75S3B receiver, 32S1 Transmitter, 516F2 Power Supply. Very clean. Only scratches are on the Rx tuning knob insert. Rx tuning dial needs adjusting to eliminate occasional slip. Full documentation, original Rx manual and repo of Tx manuals. Comes with Astatic Model 10DA mike and "G" stand all in perfect chrome. Mike stand painted base has minor scratches. This was my 1960s "Dream" station and has operated well on SSB, CW, and RTTY for many years. This pair drove my Henry 2K Amp (see my other FS post). Price is $975, you ship and pack.

UTICA 650A, 6 meter AM Transceiver - with Matching VFO. Has the 12V Cable and 110V Cable - AND Orig Manual. Haven't turned it on in 25 years. It's all Factory Chrome - kind of nifty looking. I bought it new in 1965.

$125 - you pay shipping.

Would trade for a new 7200RPM 30 or 40G IDE Hard Drive or a new CD-RW 12X or 16X

Alan

Anyone have an old EICO CB, carcass, parts, or a complete unit??
I think it is a model 377. Small, almost square looking brown box.
Thanks for any info. I have two junkers, and thought I would re-build one.
Why, you ask??
I dunno. I'll never use it.
Its simplicity intriques me. Just can't throw stuff out that can be made
working!
Thanks....Dave

A couple hints on these units:

If you build a power supply for them, consider using at least a partially-filtered DC supply for the tube heaters. I know, the "standard" bench power supply for these used AC, but you get a LOT of hum-- the unit was designed for nice clean battery operation.

One of the ones I had has the right two cal books, but it was a bit off on calibration at the bottom of the ranges. Usually this means the inductor is too small. I cant imagine how this non-adjustable ceramic core inductor lost inductance! But with a tad of ingenuity you can drill a hole in the side of the chassis and screw in a brass screw and slug from a 3/8 inch coil. This provides just enough adjustment range. it looks funny to have this 1.5 inch ceramic coil with a 3/8 inch slug in it, but it happens to work perfectly.

They are a tad ugly to female eyes-- better not keep it in the living room!

Regards,

George

Help
Thanks to all that helped me identify the TCS receiver earlier, I'd be grateful if anyone could help me locate a schematic and component list on the net - I found one but the resolution is very low.
Also my TCS has a 12J5 (triode) for the audio output even though it's marked as a 12A6 on the chassis, is this just a mistake or would it work?
Thanks

John

2692. FS Henry 2K Amp

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-04 23:41:30 UTC
From: Russ Ellsworth <erg6@qwest.net>
Message-ID: <7l6v7.634$sE3.242808@news.uswest.net>
Source record: 49186

Console model. Pair of 3-400Zs. Full output (1200 watts SSB, push to 0ver 1500 but not by me. 800 watts RTTY without overheating) from installed pair and comes with an extra pair of tubes(used but good). Cosmetically it is clean, no deep scratches or dings but it dates back to the 1960s so perfect it isn't. All metering works correctly. Currently driving with an TS850 SAT and the T/R switching relay in the Kenwood handles the Henry relay without problems and has for many years. This is a real Amp and weighs in at about 125 pounds so shipping would be a problem. I could meet most anyone interested in the western half of the US somewhere half way to Boise, Idaho. Perfect match for your dream station of the 1960s with a Collins S-Line. See my posting for a nice one! Price with spare tubes is $650.

This is a p-p tetrode two meter linear amplifier Lafayette offered back in the late 60's. Transistorized power supply for the B+, fair condition with one tuning knob not original. Originally it was a companion amp for 2M AM tranceivers.

Bench checked and it puts out a solid 50 watts with 5 watts of drive.

Interesting item for collectors, or someone who wants a bit of ooompf on SSB.

e-mail with an offer and we'll go from there.

2714. Thinking about a restoration

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-05 22:31:41 UTC
From: Mike Garber <mgarber@wi.rr.com>
Message-ID: <hxqv7.70972$ME2.10788109@typhoon.kc.rr.com>
Source record: 49107
Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.boatanchors

So...

Having the dialstring break on my beloved Hallicrafters SX-62A
the other day, I took the chasis out and am now contemplating
a restoration of sorts. Some questions, if you dont mind (Im
obviously new at this):

- Walking into Amateur Electronic Supply ("The Candy Store") in town
here, I asked for some dialstring. The guy stared at me and said "No
ones asked for that in 5 years; we dont carry that anymore". After
much discussion amongst all the folks there, the conclusion was that
dental tape (wide floss) would work the best. Whad'ya think?
*** NEVER MIND**** I just now read the "Dial Cord Sub" thread.

- The chassis is/was mostly dusty. Ive experimented spot cleaning it
with SimpleGreen, amonia, alcohol, and each works OK, but the
chassis still lookes oxidized. There is a single smallish (1" dia)
rust spot that I finally took a Dremmel with the small wire brush to
(while holding a vacuum close by to suck up the debris), and wow,
did THAT ever shine up that chassis. Whad'ya think - go for it on
the whole chassis? Or is it asking for trouble? Is it worth it??
There are a couple of numbers inkstamped on the chassis (QA #s ?)
that'll endup being removed, but that wouldnt bother me, unless it
drastically reduces the radio's value.

- Recap. I'll probably replace the "Black Beauty"s, and Pink "Tiny
Chief"s. Man-O-man; I count 43 of 'em. Anybody wanna try to talk
me out of this?????? Please??? (A handfull of electrolytics, too).

- Realign. Ive got an old RF generator, but no freq. counter. The
manual sez that for the IF allignment, use an APPROX 455kc signal.
Wouldnt an EXACT 455kc signal be better???

Without an S meter, would peaking the stages be better done by
meter monitoring the audio output, meter monitoring somewhere
else, or is "by ear" sufficient??

When it indicates a L/C pair to adjust, isnt it suitable to adjust just
ONE of these components?

-

Any other suggestions, comments, or things-to-watch-out-for would be
very much appreciated.

Thankx
Mike Garber

Beat your sig gen to 910kc on the AM-BC band. That will be plenty
adequate.
>
> Without an S meter, would peaking the stages be better done by

Simply monitor the AF out with a meter. The ear/brain combo isn't as
accurate at finding a peak.
>

Depends how far off it is and how accurate you want it.

Mike,

It ain't broke, don't fix it!.

Put a new dial cord on. Dust it out with an old paint brush and use it!
Practice restoration on some old $5. AA5, several of them before you
tackle your favorite son.

Murphy's Law - What can go wrong, will.

First you'll need a good VTVM, to monitor the AGC voltage. Youll need a good high impedance meter here, 10 megohm or better. First set your sig gen to the IF of 455 kHz and rock back and forth to find where your transformers are peaked to. The rest of the alignment should be okay, unless you've already used your diddle stick to adjust things.

The smaller value caps under 1 mfd are probably still just fine. The electrolytics are usually just in the power supply B+ and the cathode bypass of the audio output stage. I'd only replace them if you have a noticeable hum in the audio. If the cathode bypass opens up, you'lll get a bit less audio, but it will sound just fine. If it shorts you'll get a real distorted, almost useless audio.

If you see any paper capacitors sealed in wax, change themm out. They leak over the ears and will fail sooner or later.

And get the owners and any service manuals you can. I think Sams had that in their Photofacts too, another source. A total alignment is only needed if you want to get the dial calibrations closer than they are. They would vary widely from the factory, as long as the overall sensitivity was in spec. That is the first giveaway to alignment problems.

The rest is mostly mechanical stuff. Cleaning the rust off, restringing dial cords, etc. Good luck . . A friend of mine has one of those and it is quuite the receiver. Nice aoudio too, if you put on a good 10 or 12 inch speaker in a box. Remember that the audio impedance is 500 ohms, so you'll need a transformer to match it to the speaker.

A couple of places you could try (I haven't) are
www.cabinetparts.com
www.wwhardware.com

Not the same as having an original but may look the same.

I have seen similar parts advertised in woodworker catalogs
but don't have any at hand at this time.

Goto: http://www.radioremembered.org click on the
Restoration/Troubleshooting Tips, Hints, and Kinks link, then the
Checking Signal Generator Calibration link.

> Without an S meter, would peaking the stages be better done by
> meter monitoring the audio output, meter monitoring somewhere
> else, or is "by ear" sufficient??

Monitoring the audio output would be best, turn the volume control
fully clockwise, use the most sensitive scale on the AC meter and
keep the signal generator output so that it just gives enough
indication on the meter for peaking. As the signal peaks, reduce
the signal generator output. The idea is to keep the AVC from
taking over and causing false peak readings.

>
> When it indicates a L/C pair to adjust, isnt it suitable to adjust just
> ONE of these components?

Usually if both L and C are to be adjusted, C is adjusted for the
top of the band (higher frequencies) and L for the lower end of
the band.

2725. Ham Radio Movie Trivia -- "Hatari !"

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-06 03:10:26 UTC
From: cathexis@your.haterols.com
Message-ID: <3bbe70cf.270201536@news.erols.com>
Source record: 49119

Greetings,

Well I swore I was too tired to stay up for another round of radio > midnite and work in the morning. So I watched "Hatari !" on TCM. Lo and behold,...A Ham Radio. There was a boatanchor in the Main Room and when they went rhino hunting - paired into 2 Land Rovers- they stayed in touch with mikes they would raise up and speak into. No callsigns as I recall. Later on in town chasing the beautiful Frech girl "Dallas" you could plainly see what looked like VHF Hamstick-type antennas mounted to the outside edge of the windshield frames (A la military style of old).

Anyone know what the boatanchor was? Rectangular, about 16" wide and 24 high. Two rows of three large round knobs. Gray cabinet with a oval red (?) logo on it near the top. Large hand mike.

The movie dates from early 60's I think, which brings up a couple other questions. Just when did mobile Ham get started? And how really serious were authorities in the 3rd world back then (Africa) about you actually having a callsign in the first place? It would've been quite a QSO to be working hard-drinking, grizzled Rhino Hunters while chasing some DX ! <grin> Back in the 50's/60's was it possible to find whomever on air or has it always been Hams?

Just a few questions on a sleepy saturday nite. Hope you respond.

73 de KG4JBM/ Andrew

Mobile Ham radio started well before WW2.
By the 1950's it was pretty common, certainly in the UK, USA, etc.

Most African and similar countries are far less concerned about callsigns
than the developed countries, and back then I suspect that there wouldn't be
enough people with receivers nearby to even notice.

However, the equipment could just as easily have been on a different
waveband, either with or without permission.

> > drastically reduces the radio's value.

Personally, I would give the chassis a good cleaning with your chosen liquids but not try to grind it down to a mirror shine. Some day you (or your kid or your grandkid) may want to sell it, or even use it, and original numbers = authenticity. The chassis probably wasn't mirror-bright when new, anyhow. Make it clean and stink-free, and preserve some originality for the next generation.

> > - Recap.

It is a tedious job, but worth the time if you intend to use it regularly. See the article at http://antiqueradio.org/recap.htm for advice on recapping if you need it. See the restoration case study of my SX-42 (similar receiver) at http://antiqueradio.org/halli07.htm for some examples of what may get fried if the wrong old paper cap goes blooey.

> > Wouldnt an EXACT 455kc signal be better???

If you have an AM radio with digital tuning, set it to double the signal generator's frequency (i.e., 2 x 455 - 910) as a doublecheck. I always do this, although the truth is that my unrestored cheapo EICO 324 signal generator is still only a hair off the dial setting in that frequency range.

> > meter monitoring the audio output

Best.

> >is "by ear" sufficient??

No. Compare meter to ear on a few sets, and you'll see. This is not a simple 5-tube table set, where "by ear" might get you by.

> > Any other suggestions, comments, or things-to-watch-out-for

I haven't rebuilt an SX-62, but I'm guessing it's quite similar to the beloved/dreaded SX-42, which tended to burn up its (HARD-TO-REPLACE-OR-FIX) bandswitch, tone switch, and whatnot if certain paper caps leaked. See above SX-42 article for more details on what can happen. Kinda like looking at the posters of hideous gum disease in your dentist's office. Yes, it's tedious to brush and floss, but anyone who's had gum surgery would not want to repeat the experience :-)

Yes, I DO use it alot, and I HAVE read that horror story. I'll be ordering
some Panasonic polypropylenes from Digikey on Mon. I kinda had my
heart set on Sprague "orange drops" (keeping it All-American), but Digikey
doesnt sell them.

GREAT audio, and descent performance. I must have a latter model,
'cause the output Xformer has taps for 3.2, 8, & 500 ohms.

Gary Hildebrand wrote:

I have a manual reprint from W7FG, and the schematic is almost unreadable.
I might look around for an original, if I can find one for reasonable $.

Thankx again!!!!

Source record: 49132

Due to popular demand, the facility to find out "what schematics exist
for this tube" have now been put back on. TDSL is at:

http://www.duncanamps.co.uk/cgi-bin/tdsl3.exe/

Also, from today there is a facility to submit your own schematic links.
This will get extended in the fullness of time to cover pictures of
tubes, and data sheets.

Thanks for the feedback and emails, it's this kind of thing that makes
the facility better as it goes along.

Is that sorta like drilling a hole in the bottom of a boat to let water
out????

I wouldnt dream of it in 1000 years, nor would I ever imagine that
anyone else would consider it!!!!

Actually there are 2 small holes in the top that used to hold a small
speaker, but
since the top is perferated, its not too noticeable.

I can't help you from here, but In order to not blow your power supply capacitors, turn you power on initially for only a few seconds at a time. This gives the electrolitics enough time to reform. Gradually increase the time until the equipment is warmed up .
Also, try any of your local ham clubs for advise.
Good luck, Howard Pritchard K3WLG

Hi,

>> > Wouldnt an EXACT 455kc signal be better???

Tsk tsk, no one has mentioned why you don't do this. You always
tune the IF to match the crystal filter.

Black Beauties and Tiny Chiefs are equally bad. You may not notice
much change after you replace them, but the AVC will work better, and
you'll avoid frying some components eventually, as has already been
mentioned.

> I'll be ordering
>some Panasonic polypropylenes from Digikey on Mon. I kinda had my

This will just make you feel bad, but at the Hosstraders hamfest
yesterday, in New Hampshire, a ham who worked at the SBE (Sprague)
factory in Barre, Vermont was selling bags of assorted Orange Drops,
production overruns, all 400V and higher (up to 2000V!) Mylar and
polypropylene. They were $20 a bag, and I counted almost 400 caps in
one. I bought four. Now I gotta sort them into baggies: about fifty
different values.

OK, so this rig is "discontinued" and "no longer supported" (shame on Kenwood!
Sears would have done better!).

But that doesn't make it "obsolete" as someone called it. I just wanted to
know if there was something really "behind the times" about it.

We all have plenty of gloriously obsolete gear that weighs a lot less :-)

I recapped my SX-62 about a month ago. It worked, but the recap made a big difference. Checked the removed caps on my Heathkit cap checker and all were very leaky. Most couldn't even open the eye on the bridge. Maybe the radio's circuits are less sensitive to leaky caps than the cap checker, but the radio did draw about 200 ma less power after the recap.

Your AM IF frequency is shown as about 455kc because the signal generator frequency must be matched to the crystal filter. This is real touchy and it's best to use a signal generator that tunes s-l-o-w-l-y across the 455kc region. You won't need your dial calibrations, however!

if you need a manual, there are a couple of vendors selling repro manuals on e-bay at good prices. I bought one, and it's better than the usual photocopy.

uk.radio.amateur,rec.radio.shortwave,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.antiques.radio+phono

Looking to buy any Eddystone radio equipment for my collection.
Prefer items in good condition but will consider anything. I will
always pay the best price and collect anywhere in the UK, (will buy
from overseas also). Turn that old item gathering dust in the garage
or attic into money!

As well as receivers, I am interested in panadaptors and accessories
such as loudspeakers (round or oblong), S meters and spares. Also any
old documentation etc.

I am especially interested in finding a synchroniser (synthesiser) for
my 1990R.

Just let me know what you have available and I will give you a price.

I have a full original maintenance manual for a US Army Airforce
SCR269 Radio Compass (approx 200 pages). Available free to anyone
(probably suit a museum or collector)
Just cover postage and packing which in the UK will be about ï¿½5 due to
weight.

FOR SALE:

Panel meters:
Weston Model 475 with 0-100 mA dimensions 3" square with rounded
corners.
Requires a 2.8"
diameter hole. Excellent condition.
Will sell for $10.00

General Electric Type
CG22130 with 0 - 1.0 RF Amperes dimensions 2.5" diameter, round meter
requires a 2"
diameter hole. Excellent condition.
Will sell for $10.00

Rotary switch, brand new, 4 Pole 13 position with standard 1/4" shaft.
Has nice fiberglass wafers, approx 1.5" diameter -
will sell for $12.00

B & W Miniductors, new in boxes and unused:

B&W 3007 QTY 1
B&W 3010 QTY 4
B&W 3015 QTY 3
B&W 3016 QTY 8

Will sell each for $5.00 a piece

James Millen Company Magnetic shield # 60042
New unopened, and unused, in orginal packing bag.
Approximately 7" tall and 2" in diameter with
4 mounting holes on the base and a clamp on the top.
Have QTY 5 of these for sale at $6.00 each.

Air wound coil 2.5" diameter 3" long 32 turns approx 10 t.p.i.
of about 18 or 20 gauge wire. Will sell for $4.00

PLUG-IN coil unit. Marked 51B260 and 2.5 - 4.3 MC.
Not sure what this is from - has a ceramic bar with
five banana type plugs. Bar is 4-5/8" long. plug spacings:
Far pins about 4.2" apart, inner three are about 9/16" apart.
This is a link-coupled unit with a pair of coils. The inner coil is
2-1/8" diameter, and the outer coil is 2-1/2" diameter.
Good condition. Not broken. Will sell for $5.00

Shipping additional on all items.

Filament and Plate Transformers -

All with 115-120V AC primary

7.5V at 20 Amps - will sell for $35.00

7.5V at 51 Amps - will sell for $95.00

400V at 250 mA and 6.3V at 3A - will sell for $35.00

950V CT at 135 mA will sell for $40.00

1050V CT at 75 mA will sell for $35.00

UPS Shipping additional

2759. Help - Signal Generator by Channel Electronic Ind Ltd

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-07 12:59:50 UTC
From: vk2ua@yahoo.com
Message-ID: <3bc05051.46266806@news.zip.com.au>
Source record: 49053

Hi

I wonder if anyone can give me some info on a miniature signal generator made by Channel Electornic Industries Ltd? The unit is very small (5" x 3&#65533;" x 1&#65533;") and covers 120khz - 20mhz in 5 bands with AF mod option.

I am guessing that it was made in the UK in the late 1960s, but would appeciate a copy of the instruction manual or circuit as well as confirmation of its origin and date.

Thanks

Simon

Source record: 49058

Lanny,
To my knowledge there is no difference between the 10D sold today and the one sold in 1963. The 9V battery you referenced is probably for a preamplifier board - in other words, the mike you have is preamplified. The head could be a D104, 10D, etc.

2765. FS: Collins 75S-1 Receiver Needs Parts & Work

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-07 15:38:02 UTC
From: mc@NOSPAM.sover.net
Message-ID: <3bc0763f.24202512@news.sover.net>
Source record: 49059
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

I acquired this COLLINS 75S-1 RECEIVER as a parts rig. However upon close examination I came to the conclusion that it would be a shame to part it out since I feel that it could be brought back to useful ans servicable status with just a few common and relatively inexpensive parts and a bit of work. You could find all the parts easily in the rec.radio.boatanchors newsgroup or Collins Collectors Association Mail Reflector or Website. I will provide the info on these sources to the buyer. This would be a good project radio for someone who has some basic radio repair skills and wants a good Collins radio receiver without spending a lot of money. Cosmetically speaking it would need very little to make it look very nice.

There is no evidence of "butchering" and hacking of components. Everything appears to be original and I do not see any obvious signs of excess heat, modifications or repairs.

Unfortunately time constraints prevent me from doing this in the foreseeable future so if YOU have some basic skills and some time to look for the missing parts and to do the work you will have a fine early COLLINS 'S'-Line receiver for your efforts.

Here's what I see is missing:

2.1 Kc Mechanical Filter (Not hard to find or big bucks to buy)

100 Kc calibrator crystal

all band crystals

2 - pointer knobs

1 - AF Gain knob

1 - RF Gain knob

1 - Calibration index knob

1 - Misc knob

1 - Angle Bracket above PTO

the winged emblem on the front panel.

and finally the cabinet/feet.

The receiver has all its' tubes and the WATERS Model 337 SIA 'Q' Multiplier/Rejection Tuning Add-on.These in themselves are pretty hard to find and if I do not sell it as a project radio I will probably

remove this add-on and sell it separately.

I am asking $350.00 plus shipping. If interested please reply by e-mail.

73,

Michael Crestohl,
W1RC

Source record: 49061

FS an exceptional Hallicrafters Cyclone III, Model SR-400A, HF Transceiver plus matching PS-500A AC Power Supply and Sure 404C mic. Also included, a box of 16 spare tubes, extra 6KD6s, 7059s, etc. This is the latest version of the Cyclones with the 6KD6s rated at 550 watts input on SSB and 350 on CW. The transceiver is all original and has not been used much. It works good but does need some peaking up. The finals are new and need to be neutralized. The paint is all original and good, except for some small spots that are peeling, a common problem with these radios. Price is $645 plus shipping from 79602. Thanks, Charlie Hugg, K5MBX

2768. RCA Radiomarine Receiver Model AR-8510

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-07 16:49:41 UTC
From: John Morris <moe@email.msn.com>
Message-ID: <#5sJW80TBHA.1612@cpimsnntpa03>
Source record: 49062

This receiver is a RCA Radiomarine AR-8510 LF/MF Coverage Receiver.
It is 5 tubes and was made from 1945-1948.
Coverage is 15-650 kHz in 4 ranges. Has built in speaker and also separate 4 and 16 ohm output.
Requires 6.3 vAC/vDC at 1.8 amps and 90vDC at 15 ma.
There is no case and the clear plastic dial cover is cracked. I have never fired this thing up but it looks like its in good shape for a 60 year old unit. I got it with a number of other Radiomarine sets that work fine.
I also got with it a black wrinkle 1.5" rack panel that has a nice metal tag on it that says it was a "Test Bench Assembly"
Pictures of the receiver AND the rack panel are available upon request.
Many of the LF receivers I've seen weigh a ton. This doesn't. It is easily shipable.

Its available for $50 plus shipping from 98008.

73's

John - WB0RLD

2774. 5763 tubes for sale (cheap!)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-08 03:01:32 UTC
From: mjsilva697@earthlink.net
Message-ID: <27085883.0110071901.7c2bf190@posting.google.com>
Source record: 49068
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew

I am posting this for somebody I have had good dealings with. She has lots of 5763 tubes that she would like to sell for $25.00 per hundred (yes, 100). She wants to be able to park in her garage again <g>. These are late production (1985) Phillips / JAN.

For those who don't know the 5763, it's a 9-pin mini beam power tube, good for up to 175 MHz. Plate dissipation is 13.5W, maximum B+ is 350V*, max Ip is 50 mA, and gm is 7000. Unlike most beam tubes, the beam plates come out on a separate pin, so there won't be excess coupling to the output in circuits where the cathode is above RF ground. Overall I tend to think of the tube as a high-gain 6AQ5 with good RF credentials.

The 5763 was one of the ARRL recommended oscillator tubes, along with the 6AG7 and a few others. It was also used often as a driver tube, and as a PA tube for low-power and/or mobile rigs. One of the last ARRL "How to Become a Radio Amateur" tube transmitters was a 6C4-5763 rig. It has a fairly high gain/Cgp ratio, meaning one should take reasonable precautions in layout, and it may in some cases need to be neutralized. I don't see why it wouldn't also make a good audio tube akin to the 6AQ5 and 6V6.

* Given that the plate is on pin 1 and pin 2 is a N/C, I'd bet the tube could be run at up to 500V by removing the socket connector for pin 2 (to extend the leakage path). That would be 25W input for a 25 cent tube...

Reticulum <cathexis@your.haterols.com> wrote:
>Just when did mobile Ham get started?

About 1925. The original amateur mobile station, 6GD-6BKA, had equipment that for the first time used the same circuit and components for both transmitting and receiving giving rise to the word "transceiver." Apparently in later years the regs were quite restrictive. Finally, around 1950, the FCC relaxed the mobile regulations; interest in mobile operation took off after that.

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any amateur topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefaced
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

> production overruns, all 400V and higher (up to 2000V!) Mylar and
> polypropylene.

I saw those, and looked carefully at the listed values on the sign
several times. ALL I saw was ".00047, and .0047 mfd", so I didn't look
any closer. Guess that sign had *nothing* to do with the actual stuff,
or I would have bought some :(

Two receivers for sale: At present, both are from an estate and have been sitting for several years. Neither are checked and are sold as-is at these prices:

1. Hammarlund SP-600 receiver, appears complete, was told it works but don't plan on it. Front panel looks pretty clean and will probably compound/wax out nicely, knobs are original, some corrosion on chassis (can be cleaned up), original meter and knobs, has crystal deck, manual, rack mounted, $290.

2, Hammarlund HQ-170, with clock, has the noise blanker, very clean front panel, original knobs, nice cabinet with original paint, may or amy not work, $150.

3. Hammarlund HQ-129X, good front panel, cabinet is wrong color, knobs probably aren't original but look good, may or may not work, manual, $85.

2786. Here are some rare sets FA

Hello all.....As per the subject, looking for a schematic for this 10KHz to 120MHz signal generator. The section of current interest is the power supply which has failed, so a partial print...scanned would be appreciated......or.....even the details of what the regulated voltage should be after the main pass transistor. Any help appreciated.

Sincerely,

Gord - VE1AJF

Dear All,
I could also do with a manual for this generator. So, if anyone can
scan at least the circuit, ideally the whole thing, I would be extremely
grateful.

2793. FS: Two SERVICE MANUALS for AUL SG-1144/U Signal Generator

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-08 21:26:36 UTC
From: tomg@fullnet.com
Message-ID: <11915d6.0110081326.4d47464a@posting.google.com>
Source record: 49087

Two SERVICE MANUALS for AUL SG-1144/U Signal Generator: $15

I have for sale two different SERVICE MANUALS for the AUL Instruments, Inc. SG-1144/U Signal Generator, on a CD-ROM disk.

One manual is 241 pages and the other is 136 pages. They contain just about everything you'd ever need to know about using and maintaining the SG-1144/U.
They are in Adobe Acrobat format PDF files. One of the files is 5.873 MB (megabytes) and one is 1.539 MB. The files are read using the free, downloadable Adobe Acrobat reader. They can also be printed. They are searchable, and are hypertext-linked, so they're very easy to get around in. Acrobat even lets you magnify things, which could be great, if your eyes are getting bad.

Here is the text from the cover of the 241-page manual:

"TM 11-6625-2954-14&P,
TECHNICAL MANUAL,
OPERATOR'S, ORGANIZATIONAL, DIRECT SUPPORT AND
GENERAL SUPPORT MAINTENANCE MANUAL
FOR
SIGNAL GENERATOR SG-1144/U
(NSN 6625-01-075-8478)"

"This copy is a reprint which includes current pages
from Changes 1 and 2. Title was changed by Change 2.
HEADQUARTERS, DEPARTMENT OF THE ARMY
30 JANUARY 1980 "

And here are the chapter titles from the manual:

SERVICE UPON RECEIPT AND INSTALLATION

OPERATING INSTRUCTIONS

OPERATOR/CREW MAINTENANCE

ORGANIZATIONAL MAINTENANCE

ALIGNMENT AND ADJUSTMENT

FUNCTIONING OF EQUIPMENT

GENERAL SUPPORT MAINTENANCE

ALIGNMENT AND ADJUSTMENT

GENERAL SUPPORT TESTING PROCEDURES

ILLUSTRATIONS

REPAIR PARTS AND SPECIAL TOOLS LIST

plus numerous Figures, Tables, and Appendices

Here is the text from the cover of the 136-page manual:

"TM 11-6625-2954-24P,
TECHNICAL MANUAL,
ORGANIZATIONAL, DIRECT SUPPORT AND
GENERAL SUPPORT MAINTENANCE
REPAIR PARTS AND SPECIAL TOOLS LIST
(INCLUDING DEPOT MAINTENANCE REPAIR PARTS AND SPECIAL TOOLS)
FOR
SIGNAL GENERATOR
SG-1144/U
(NSN 6625-01-075-8478)
HEADQUARTERS, DEPARTMENT OF THE ARMY
24 NOVEMBER 1982"

This second manual contains mostly diagrams and parts lists.

Price for the two manuals: $15

Optional FREE DELIVERY worldwide, via email! (Pay with PayPal and get it really fast!) OR, optionally: Buyers in Continental USA can pay $3 for First Class Mail or $5 for Priority Mail, while International and other buyers would pay actual shipping charges and non-USA buyers would also pay an additional $5 packaging and handling fee (Email me for shipping options and costs: tomg@fullnet.com). Price refunded if DOA, otherwise sold as-is. Payment accepted: by credit cards (MC and Visa), only through secure site at Paypal.com, and, by postal money order, cashier's check, or personal or company check (checks may delay shipping until cleared). International buyers: Paypal or International Money Order ONLY.

Thanks!

>any closer. Guess that sign had *nothing* to do with the actual stuff,
>or I would have bought some :(

Probably that's all he had left, after the assorted bags ran out.
There were a bunch of those values: .00047 @ 2000V and .0047 @ 330VAC,
800VAC and 1000V. But generally the values were evenly scattered from
.00047 to 0.47. The physically largest ones were .14 @ 800V. Most
were odd values or higher-than-normal-catalog voltage ratings, or were
OEM branded (who is "Dr. Z Amps"?) But all were film-and-foil, not
metallized film, and most were polypropylene. I really had no idea
what these things sold for, until I checked the Mouser catalog when I
got home, but for once I guessed right.

Cheers, Alan

I'd be worried about the vibration hurting a tube, or debris shorting
something.

>
>
> - Recap. I'll probably replace the "Black Beauty"s, and Pink "Tiny
> Chief"s. Man-O-man; I count 43 of 'em. Anybody wanna try to talk
> me out of this?????? Please??? (A handfull of electrolytics, too).

Replace, one at a time, all these caps. See:
http://www.geocities.com/wa2ise/radios/repair.htm
and
http://www.antiqueradio.org/recap.htm
Though I would not attempt to desolder the old cap leads. You
would risk breaking a tube socket terminal or bandswitch.

>
>
> - Realign.

I would not do a realign. Replacing the wax caps, black beauties,
and such should not affect the alignment.

>
>
> When it indicates a L/C pair to adjust, isnt it suitable to adjust just
> ONE of these components?

Whichever one is designed to be adjusted. Trimmer cap or adjustable
slug.

Source record: 48997

I have an nice SB-101 HF transceiver for sale. It is very clean. It has a mic clip mounted on the right side of the case. The tuning knob and calibrate needle work well. It looks to be original and I haven't found any mods other than the mic clip. I am listening to 8R1USA (Guyana) on 14.207 MHz right now. I have not tested the transmitter (lousy antennas right now.) It does not have the CW filter installed. Check the link for a picture. I do not a manual for this rig. Asking $125 plus shipping. I have a power supply, cable, and CW filter available separately if you need any of those.

Notice the poor transmitter IMD numbers which is a total disgrace from amateur radio compnay. It is quite interesting to read the review of the FT1000MPmkV, and the reviewer there boasted how the ARRL paid attention to the cleanliness of transmitter IMD numbers. Yet they refused to mention that the TS2000 was crappy class C transmitter. Even most CB radios record better transmitter 3rd order IMD numbers. Besides numerous people have pointed out to them that they way they measure transmitter IMD makes the result 6db better than they really are, yet they refuse to change their methods.

If you plan to use this radio on HF with a amplifier, make sure you dont show your call at the next hamfest. But hey if you get hatred for having a dirty signal i wonder if Kenwood would give your money back for producing such a terrible transmitter..

2823. Mechanical filter?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-09 21:33:57 UTC
From: Bob Liesenfeld <wb0poq@visi.com>
Message-ID: <3BC36D45.1BB7F8EF@visi.com>
Source record: 49017

Hi folks,
I have an Allied A-2515 receiver (built by Trio in Japan) from the late 60s/early 70s that has 4 filters in the IF strip (455KHz) that the parts list calls "mechanical filters". They are in a can about 9/16" high by 3/8" wide on a side. There is a single cup core type adjustment in the top, offset from center. The only markings are "L4012" and "29"

I have taken one apart and here is what is inside:
There is a bobbin core with 3 windings on it. One of the windings has a 150pF cap in series with it. Another has a tiny disk with two leads in series with it. This disk is about 5mm in diameter, and perhaps 1 or 2 mm thick. It is a gray non-conductive material. It appears to be plated on both sides with a copper colored material to which is soldered a fine wire. (I have seen capacitors in IF cans constructed like this before...is that what this is?)

The coil/cap combination is connected in parallel with the coil/disk combination. The third winding simply has its leads brought out of the can. All three are wound on the same bobbin, and tuned by the same cup core.

In circuit, the lone winding has a 330pF cap across it, with one lead grounded, while the other is fed through a .002uF to the base of a common emitter BJT amp.
The two parallel connected winding networks have a 10K resistor and a 1000pF cap connected across it. One end of this combination connects to bypassed Vcc, while the other connects to the collector of the previous CE BJT IF amp.

I have a .bmp file of this whole mess if you want to see it. My question is: What exactly is this thing? All references I can find on mechanical filters talks about tiny disks supported on 3 or 4 rods, with a coil on the input and a coil on the output.

Whatever they are, they do provide some serious selectivity. AM broadcast signals suffer from lots of sideband cutting. The specs claim +/- 1.5KHz at 6dB down, which seems to be about right.

Thanks for any input.

72

Bob Liesenfeld <wb0poq@visi.com> wrote in message news:<3BC36D45.1BB7F8EF@visi.com>...

Bob, I have a TRIO 9R-59D which contains a pair of TOKO mechanical filters. Each looks like two small IF cans joined together, with an adjusting slug on top of one can. I never opened mine, but I have peaked them up during IF alignment. The overall selectivity of the receiver is about +/- 1.2 KHz at the
-6 dB points which makes for great selectivity, but lousy AM (as you noted)!

Did you ever get the matching speaker for your radio? It's an Allied A2514. It's exactly the same as the TRIO SP-5D which is the matching speaker for my 9R-59D.

Ken,
VE3FIT

I'm rebuilding a couple of radios and need
the following parts:

National NC-173 (NC-183(D) parts are virtually the same)

o CF-1 Crystal Filter Phasing Control unit (probably
marked "CA 3659) - or - C29 Phasing control cap.
o Antenna terminal with shorting bar.
o Ground terminal (chassis ground).
o Speaker terminal.
o Tuning & Bandspread knobs with Chrome inserts,
and most other knobs.
o National emblem.
o Any other hardware & chassis parts (screws, nuts, etc...)
that you're in the mood to get rid of.

National NC-183D:

o On/Off/Volume Knob.
o NFM-83-50

Hallicrafters S-77:

o Full set of knobs.

Thanks,

John

> something.

Yes, I would resist the urge to buzz all over the chassis with a Dremel brush. When I use those things to polish metal, I notice tiny metal bristles and bristle ends flying all over the place after a while. Not the sort of thing you want inside your radio chassis!

> I would not do a realign. Replacing the wax caps, black beauties,
> and such should not affect the alignment.

It is certainly worth giving it a listen after you finish recapping. If the radio seems to perform fine, then declare victory and enjoy your restored treasure. And if you feel the need to go further . . . note that AM alignment is easier than the FM. If your FM sounds reasonable, I would leave it alone unless you have done this before and feel confident.

Phil

I am looking for a nice looking and good working 2 meter amp. Please state
available plate voltage, plate current and power out.
Thanks for reading the post.
BTW it will need to do more than 160 watts. I am looking for around 300-350
at the meter.
thanks and 73 donald wk6q zip in No Cal 95969 for shipping costs

Very useful item for maintenance of your ham gear, new or old. Can be used
as part of the sensitivity tests, alignments, trouble shooting, carrier
leak, etc.
Good for below audio up to 10mhz.
Goes down to a .001VRMS full scale up to 300V scale position.
With HP manual. Also has DB scales. Excellent condition. k4gj

This is an L-network antenna tuner with a difference. Has
phase detector to show reactance of load via a meter and a 2nd
meter to show "R."

Rack mount & looks like meant to match SSB100MIL.

One here is SN 600 & has a sizzled phase detector.

Anyone here have a ckt. diag.?`

Thanks for reading!

2846. US DROPS BAYGEN RADIOS ON REFUGEES, more

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-10 19:51:23 UTC
From: radioman390@cs.com
Message-ID: <20011010155123.02028.00001640@mb-cf.news.cs.com>
Source record: 49040

Yep, the BBC reports that Baygen radios (which wind up) are being dropped on refugees from the Taliban so they can listen to Madonna and PuffPiddle between propaganda from VOA, BBC, etc..

The Signal Corps is dropping the last of the Tobbyhana R-390s on Bin Ladin's people, without a parachute.

May be counterproductive, though, as radio may survive fall from 10K feet, and it gives the enemy our best technology.

>1N34 diodes and CK722 transistors for over $10 ea.

In that case, the CK722 is the far better deal, as it has TWO germanium diodes in it.

I have a box of 2N35's, if I wait long enough they might be worth something. :-)

2849. How to clean up a Vibroplex??

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-10 21:06:30 UTC
From: TooManyTubes <kb8tl@yahoo.com>
Message-ID: <ts9e363i619n3b@corp.supernews.com>
Source record: 48944

Just acquired a 1929 Vibroplex Lightning with Japanned base in fairly dirty condition. Some chips to the base, some of the gold trim remains but not much. The red bug is still red.
What is the best way to clean these things up without removing anymore gold trim or red from the bug???
I'll probably take all the metal parts off and use a small buffing wheel and polishing compund on the parts that should be shiny. Some pitting but I can't tell how much through the crud...

I'd eventually like to trade this for a more modern Vibroplex bug if anyone is interested. Presumably, my '29 is worth more than a modern bug, so I'd be looking for a near mint "modern" unit. Main wants are red paddles and gray base ("original" model?) Trades in or around the Detroit area preferred.

Check your owner's manual for the frequency needed for whatever coverage
you want, then order cr;ytals from Internation, JAN or Sentry Crystal to
name a few.

Hold onto your wallet though -- they aren't cheap anymore. Now you will
underswtand why synthesized radios are common . . . .

I've acquired too many scopes, hi.

A beautiful working dual trace 50 mhz scope. Digital control with LCD display of vertical sens & sweep time. Multi function semi automatic makes this a very verstle scope. Comes with complete manuals & 2 Philips 10x probes, acces suitcase on top & front cover. The only downer I broke the plastic ring up left corner (not the panel) but epoxi fixed it ok. Hardly noticable & should give no trouble. Very clean unit. Price $195. + shipping. Want pics? Just ask.

I just got an HP-8640B signal generator from Ruthven Lewis
(rlewis5932@aol.com) through an eBay auction. It came with the
calibration certificate and in absolutely _beautiful_ shape.

I'll happily do business with him again, and wanted others to
know about him. My only connection with him is that I sent him
money and got the gear he advertised in the condition in which he
advertised it.

2866. IF Sweep Generator??

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-12 00:00:42 UTC
From: Tony Angerame <tangeram@lucent.com>
Message-ID: <3BC632A9.95FCCD43@lucent.com>
Source record: 48960

I've got an old AN/URM-25 Signal Generator. I like it. It works well, is quite stable and has plenty of output. I'd like to use it at IF frequencies as a sweep generator. What I contemplate doing is use the sawtooth waveform from a scopt to drive a varicap diode across the main tuning cap through a pot and blocking cap. Has anyone ever done this? Is this a reasonable idea to obtain a swept IF signal or is there an easier or better way?

TIA Tony WA6LZH

Just about any version manual is the same, only the meter ranges are
different. I'd suggest you contact Simpson directly for info.

YOu can use any poiinter knob that fits the shaft . . .

Hang onto that bugger, as it has the normal sexed banana plugs and
measures voltages up to 5 kV. From version 6 on, OSHA got into the
picture.

You should try it,
but be aware that the varicap is NOT linear with changes of voltage.
So your frequency will not be a linear change over time.

Sadly, one R390A web site shows a huge pile of R390As that are supposedly destined to be destroyed. Whether any parts or tubes are salvaged, I don't know. Apparently the remaining US Govt stockpiles are just being trashed, and not sold off as surplus. Wonder why? Probably too much paperwork hassle to sell them, cheaper to just drive a bulldozer over them and dig a trench.

Of course, if anyone tried to dump hundreds of these sets on the market, not that many would sell. Though a lot of us here would get a spare or two, that's for sure.

I am a R-390 fan and collector
That was called the famous St. Juliens Creek Radio Massacre all the radios were R-390 "A's" (less valued over the non A's)
The radios were called "Blue Stripers" did go up for sale days before the landfill.
You had to buy in pallets of 12, Fair Radio sales (perhaps the largest buyer) has them available, working and fixer uppers
http://www.fairradio.com/hfrece.htm as well as parts from some of the non salvageable ones
FULL STORY of the great radio Massacre here

The government has a marksmanship program set up where participating
civilian shooters can purchase its supply of M-1 rifles. I wonder
what it would take to set up such a program so that radio amateurs
could purchase out-of-date radio equipment?

2880. Diagnostic Help-TS-700s

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-12 13:31:08 UTC
From: mailfrmpa@aol.com
Message-ID: <20011012093108.01166.00003429@mb-fo.aol.com>
Source record: 48974

The TS-700s is an all-mode 2m rig of the 1970's. I just got it in trade for an SX-117. It worked when received, but has now developed a problem. I know the symptoms should point me to a specific location, but I am not being able to figue it out. So here goes:

Will receive normally on FM and AM. On USB and LSB the receiver has no audio except at full volume, and sounds like AM (or no BFO). Turning on the receiver preamp there is an increase in background noise.

Will transmitt ok on FM, but not on AM or SSB.

I have measured the voltages from ther mode switch to the GEN Bd, and there is voltage to the bd.

Any hints?

If you do modify the generator, it will affect the calibration. Why not
just build a 455 KHz (Or whatever freq) oscillator, and use that with
the varicap? If you want a linear sweep, Mini Circuits has some linear
VCO's. You could build a crystal osc, mix it down where you want it,
then use an opamp to mix the two voltages. You could built a sawtooth
generator (or use a function generator), then use a gain control to set
the sweep width. The VCO's are $11-$14 (US) each.

http://www.minicircuits.com/ Their main page.
http://www.minicircuits.com/dg02-194.pdf This will give you basic
info on their linear VCO's

The MARS program used to get these old rigs into hands of affiliate
amateurs but that now seems to have faded into the past. There was a
similar massacre of KWM-2As at the Charleston Navy Yard even during the
MARS program. The explanation at the time was just as you say - too
much paperwork.

Man, what a stack! Imagine how much all of those weigh! :)

Instead of digging a hole and burying them, they ought to just
set them out in a parking lot and let people drag them off for
free. It would cost the government virtually nothing, wouldn't
pollute the earth, and the taxpayers who paid for them would
"get their money back", in a manner of speaking. It would be a
win-win situation. Unfortunately, that would just make too much
sense for the government...

Sounds like the carrier oscillator isn't running. It provides the carrier to generate the SSB transmit, and generally serves as the 2nd LO to demodulate SSB with a product detector.

Since both USB and LSB are acting the same, it sounds like the carrier oscillator doesn't have power, or has a bad output buffer amp or connection, since there are usually separate crystals for USB and LSB. It's not impossible that both crystals are bad- the unit could have been dropped and they could have shattered.

Good luck

Tim

Message-ID: <3bc77689.62898023@news.mondenet.com>
Source record: 48990

I have a TS-700s too..and it had similar type condition. I cleaned up
all the switch contacts with a good quality cleaner spray and ditto
any contacts between cct boards to ground..in short ..any
contacts..ie wirewrap contacts etc too.
Mine now works ..but it is poor on receive..low sensitivity..and very
little volume on ssb but fm roars in.
Im going to build a really high gain preamp..10db very low noise
followed by another 10 db or so and it should be OK.
I have worked DX on it ssb ..just not much gain/volume.
i did the same procedure as above to an old atlas 210x and i got it
working too!
If you wish to compare any furthur notes..feel free to contact me..73

Anyone know the corect screw thread size that screws into the brass inserts
in these three bezels (s-meter, main tuning and bandspread)? I have tried
4-40 but it's not correct.
Thanks for any help.

Pay close attention to the crappy transmitter IMD numbers, its worst than class C. A disgrace that a company can produce such a HF transmitter and get away with it. I wonder why the ARRL did not stick to their standards and make comment. Maybe they are happy that people splatter the bands with such crap.

Thanks to the two of you who suggested the carrier oscillator. The carrier goes thru a buffer, and then an amplifier. The buffer transistor had a bad solder joint. Hence it would operate when "bumped" for a while, until the joint just became worse. Kinda a surprise on a wave-soldered board.

See you on 2m SSB!

Somebody would still be worried about those radioactive radium glow meter scales. Both my R390 and my R390A have the original meters (and my R392 has the stuff on the knob pointers!), but I hear sets like that are hard to come by nowadays.

But the only glow I really want to see are those cheery red cathodes inside -- Mike K.

Life is a game. Play to enjoy!

I am just saying I really wasnt impressed by the rig at all it was OK. But I owned the 746 and the 847 before getting the kenwood. Out of all the 746 is best then 2000 then 847 running a farrrr last. For the money the 2000 sucks it should be priced in the 746 class.

This is certainly not the first time that the ARRL review has failed to
make comment on unacceptable performance levels. BUT they do get some
credit for publishing the lab numbers so the rest of us can see the
results of the lab testing.

I picked up a pretty nice looking B&W 5100B I'd like to get on the air. Mod current rises quickly off the chart in AM mode regardless of pot setting. Changed caps,tubes etc. Now out of ideas and expertise! Anybody know someone within 100 miles driving distance of Pittsburgh who can fix this for me at a reasonable cost? All AM operator Hams in Pgh I have asked have said they are: a: "too blind" b: "have bad backs": c: "working on their own junk". d: "too old."

reply direct to k3vr@hotmail.com with phone numbers and or suggestions

Thanks -Brian

Source record: 48914

Brian,
Try the following:

The first thing is to always test the tubes and then check the voltages on the tubes.
After that - -
1. Check the electrolytic cap in the mod circuit. If that is real leaky, it will peg the meter.
2. Measure the modulation and driver xfrms with a VOM to make sure the chassis is not shorted to any of the primary or secondary leads.
3. Sometimes a modulation bias rheostat current control pot is bad. (This is not the audio control on the front panel) Check the resistance of that.

If all fails put some kind of audio signal into the mic and measure it along the audio chain. Should see a marked increase in voltage as you go along. A scope will also see the audio. Ground the scope to the chassis and then sample the audio from the input back through the circuit. it should get progressively stronger and you should find where things go awry.

As many audio circuits use roughly the same design, you wouldn't necessarily need a schematic but it is always best to have it.

Good luck.

John-WB0RLD

Source record: 48917

For sale: Very nice Collins 75S-3C receiver. Serial number 13518, MCN 1505, from my own collection. In the original Collins carton with interior packing. Complete with original line cord and additional crystals to cover the entire 10 meter band and extra crystals for several short-wave bands. Seems to be working fine, although I've had it in storage for a while, so it could probably benefit from a cleaning and alignment. No dents or dings on the cabinet, nor has the cabinet been repainted. The frequency dial has a slight yellowish tint, although there is no evidence of smoking. Appears to be a little paint touchup (about 1/2") next to the AF control. Has the filter cover and standard 2.1 kHz filter. Complete with copy of the original manual. Price $1475. delivered (USA.)

Isn't this the same radium paint used on most all of the watches, clocks and clock radios of the '40s through the '60s? Sheesh. Isn't there any sense of proportion? Don't bother. I know the answer.

They're all wuss's. You're getting into the REAL world of ham radio,
not just being an appliance (read that rice-box) operator.

Sounds like you've lost bias on the modulator tubes. I don't know if
there is a fixed bias supply, or cathode bias. If there is cathode
bias, look for an electrolytic cap across a resistor from cathode to
ground; if that is shorted, that will allow the plate current to run
away as you described. Also check if th modulators are transformer
coupled from the driver stage. Bias is fed through the centertap on the
grid windings. You might have an open winding here as well.

Not having the schematic, that's the best I can armchair-tech that rig.
Good luck, that radio is well worth restoring.

According to the B&W Service Notes, this could be due to one of several reasons. One is a short circuit from the high voltage pin to ground in J503 and P401. This is an 11-pin connector between chasis and modulator unit. Remove the old connector and rewire a new one, according to an instruction sheet in the service notes. This is especially true if your 5100-B has a serial number below 2000. It could also be due to a short circuit from high voltage pin to ground in P301 and J505--this is a 12-pin Cinch-Jones connector between the chassis and cable feeding the rf multiplier section. Both male and female part of the connector should ber eplaced and rewired in accordance with the service manual. The data also says it's possible the meter shunts are open: check R504, 505 and 506.

The "Service Notes" are available from P. A. Markavage, 27 Walling St., Sayreville, N.J., 08872-1818.

Greetings and thanks for reading the posting. I am in need of a couple of ferrite tuning slugs for the antenna input tuning coils for the Hallicrafters S-77 or S-40. These slugs are about 3/8" wide and 3/8" long and have course threads. If you have a junker S-77 or S-40 that you want to sell I will consider buying the chassis, in whole or in part if I get the slugs with it. Other Hallicrafters receivers may use the same slug. Any input would be greatly appreciated.

Thanks,
Scott M.

2935. Phase reversal in headphones for CW

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-14 06:49:25 UTC
From: Will White <googlyelmo@earthlink.net>
Message-ID: <3BC93566.7555E857@earthlink.net>
Source record: 48929

I read somewhere (???) recently that by reversing the phase of a pair of headphones (any impedance), a CW note you are tuning will be made to appear, or seem to appear, "in the middle of your head", unlike normal phasing where the signal seems to be off to the left and right. The advantage of this is that it is supposed to make it easier for the operator to focus on the one note he is trying to copy, sort of an enhancement of the old gray matter filter. So, after looking through all my ham books, including a half dozen old ARRL HBs from 1958 to 1984, I can't find any description of how to rewire a set of headphones to reverse the phase. I remember reading that the task is extremely simple. Anyone know how to do this? Please let me know. Thanks.

There's been a misunderstanding somewhere. When headphones are in phase, a monaural signal will be right in the middle of your head. It's when they're out of phase that the location can seem indefinite.

> The advantage of this is that it is supposed to make it easier for the

Listening to Morse through phones is a pretty mature technology. If phase reversal were really effective, we'd have seen phase reversal switches associated with phones for years now.

Source record: 48935

Hi Will -- with normal wiring the audio will seem to be "in the middle of one's head", reversing the wires to one of the headphones will cause a vaugue directionallity and tends to reduce the bass notes. Try it on your stereo systems speakers -- you'll hear the difference. I have talked with some operators who liked the sound of reversed phase phones. Didn't do much for me, but try it - you may like it.

Since some headphones use molded connections -- this can be tricky, so some make a small jack box and use a switch to make the signals in or out of phase. Some even use stereo phones and listen to two different signals !!! HF on one ear, VHF on the other!

Some operators use stereo phones with a variety of filters in each earpiece to create a pseudo stereo effect. Some use a low cut filter in one earphone and a high cut filter in the other. Experimentation is in order!

Hi Will:

The phenomenon you refer to is called "Binaural CW" and has been described in QST and other magazines in recent years. The "3D" effect created by binaural systems is supposed to enhance copy, especially in noisy or weak signal conditions.

A quick search of the web will reveal a host of articles and products.

==========

Will:

Actually, what you want to do is reverse the connections to one side of the headset. Most sounds that you hear arrive at each ear almost inphase. By reversing the connections to one side of the headset, the CW signal arrives 180 degrees out of phase in each ear. This phase difference makes it easier to "tune-in" the CW signal in a noisy environment where the noise arrives inphase.

The ability to listen selectively to sounds from a specific direction is called the "cocktail party" effect. You can tune-in one conversation out of many by focusing on sounds from a specific direction. In the case of the out-of-phase headphones, the sounds of the CW (or phone) signals will sound like they come from a different direction than the inphase noise in the environment.

The normal headphone inphase connection makes signals sound like they are in the center of your head. The out-of-phase connection will make the signals sound outside.

Best Regards,

Ed

Source record: 48943

For sale: Very nice Round Emblem Collins 75S-3C receiver. Serial number 13518, MCN 1505, from my own collection. Has the wide "eyebrow" on the preselector control. In the original Collins carton with interior packing. Complete with original line cord and additional crystals to cover the entire 10 meter band and extra crystals for several short-wave bands. Seems to be working fine, although I've had it in storage for a while, so it could probably benefit from a cleaning and alignment. No dents or dings on the cabinet, nor has the cabinet been repainted. The frequency dial has a slight yellowish tint, although there is no evidence of smoking. Appears to be a little paint touchup (about 1/2") next to the AF control. Has the filter cover and standard 2.1 kHz filter. Complete with copy of the original manual. Price $1475. delivered (USA.)

Hi, Mike --

Proper binaural CW, where the frequencies are widely spread across the sound stage, is just excellent. It lets the brain separate the signals without the "cramped" feeling of a narrow filter.

However, it takes a bit more than an out-of-phase headset to accomplish.

The article saw was in QST in the early '70s. And you change only one ear. I did it, andput a switch in the ear cup to allow me to switch back and forth. I didnt notice much difference.

I used a capacitor in series with one side and got a nice cw copying
effect. I forget the value...IIRC it was on the order of 1 - 10 mf (I
played with alot of values and forget where I landed. 8 ohm Radio Shack
stereo cans.

this will work on a stereo signal and stereo headphones, but a monaural
signal will sound the same if you switch the wires, all things being
equal.

Dave

> Some operators use stereo phones with a variety of filters in each earpiece

I guess some have used low cut/high cut method to make the signal travel
from one ear to the other as you tune across it. I've never done it,
but it might sound cool.

Dave

> Frank Dresser

I wondered about this myself a few years back. Luckily I knew a guy in the local University Health Physics department. He came over with a calibrated geiger-counter. At a distance of 6 inches, my R-392's S-meter (looks identical to the R-390's S meter), was giving off 3 millirems per hour.

That's not a lot, but after 4.5 hours a night, that's 1666 hours, you've used up your max allowable yearly dose of radiation (5,000 millirems). That's the USA guideline, some countries set the bar much lower.

So it's not a *great* idea to sleep with your R-390A.

BTW is we backtrack to the time the radio was new, about 35 years ago, it was putting out about 64 times as much! That was a real HOT radio!

(I've seen pictures of racks and racks full of R-390A's, whew, that musta been a real HOT joint)

Regards,

George

OK, I'm confused. I assumed radium had some large half-life, like over 1000 years. The reason these dial markings went dim was the phosphor wore out. But 1/64th the radation after 35 years? What's that for a half-life? Six months?

Also, I assumed the case shielded most of the radation. Same for the old clocks and watches. Did the old military equipment use different paint?

Are we talking about 390's or 390A's
I remember Radium dials having a green glow, the paint on my R-390 (non A's)
looks white
.....they were built around 1952 .
This is confusing, I thought the A's and late Motorola non A's used radium
meters
(thats why so many abundant 390A's are sold with them missing today)

Yeah. The white paint on the old Big Ben clocks would glow green in the dark. Maybe they could make different glowing colors with different phosphors. They still needed to excite the phospher with something and radium seems the best candidate. But that's just my guess. Nowadays they might use tritium , but I don't think it was available for that purpose in the '50s and '60s.

I know EMF and nuclear radation aren't the same, but you have to start somewhere:

http://berk.com/~lessemf/personal.html

That smart and subtle Shielded Cap sure looks tempting. A reduction in "mind noise" would do me a world of good. A 390 owner may want to consider the Full Body Shielded Suit. Ask them to replace the copper with lead.

From:
http://www.radonseal.com/radon-facts.htm#painters

The saga of radium dial painters

Shortly after its discovery radium was used to
make luminous paints. During World War I, hundreds of young women
in New York and Illinois were applying the highly
radioactive paint to instrument dials. Dial painting was expanded to
clock manufacturing, and "glow-in-the-dark"
clocks and watches became popular.

The young women who applied the paint frequently
licked the brush to keep it pointed, and their work area was
saturated in radon. Suspicions arose in the late
1920's over jaw cancers among the dial painters, and their tragic
saga slowly started to unfold. Years later, most
of these women died of cancer.

During World War II, young women painted radium
on military instruments, so that the dials would glow in the
darkness of a cockpit or battlefield. Precautions
were taken to avoid the ingestion of radium, but the danger of radon
gas was not understood. Cancer has killed many of
these women during the following 20-30 years.

Since the mid 1960's, the watch manufacturers are
using Tritium, a radioactive form of hydrogen with a half-life of 12
years, or Promethium, a man-made radioactive
element with a half-life of 2.6 years. Both of these elements are weak
beta and gamma emitters, but only few of the
particles penetrate the cover glass of the watch.

From another:

Some of these have the radium containing paint on them and are quite
dangerous.
The paint could flake or rub off and be inhaled or eaten.

I think the safe thing to do here is have the Government mandate "DO NOT
EAT" labels for R-390 meters.

-Bill

1000
> years. The reason these dial markings went dim was the phosphor wore out.
But
> 1/64th the radation after 35 years? What's that for a half-life? Six
months?

They almost certainly used "mesothorium", which is much cheaper than
radium. I forget the exact number, but the half life was something like 6
years. 6 half lives is 1/64.

> Also, I assumed the case shielded most of the radation.

Perhaps, but you still get a non-trivial amount getting out.

For years I've used a simple cable to plug stereo headphones into a mono (as in SW boatanchor rx) headphone jack. The hot and ground audio from the mono plug go to a stereo 3-wire socket, but you don't connect the ground lug -- you run the ground to one "ear" and the hot to the other.

This puts the two cans in series, which accomplishes two things -- the phase reversal (which I like to avoid that feeling of the signal stuck in my sinusus), and it also doubles the impedance of the phones. Since most headphone jack outputs are for higher impedances (either 600 ohms, or 8 ohms but with series resistors so it's back up to 600 or more), this makes the phones a better match and gives a stronger signal. 73, Mike K. ==========

What is "normal" ?

Is it when the diaphragms are both moving in the same direction,
N,S,E,W, at the same time.

Or in opposite directions, N.S,E,W, i.e., both towards the centre
of the head or both away from the centre of the head
simultaneously.

And would not the manufacturers have to colour code the wiring to
ensure "normality" during assembly ?

I've been using headphones for 70 years (began with xtal and cat's
whisker sets + S.G.Brown's iron diaphragms) and never noticed any
difference. But perhaps my sense of hearing is defective.

Somewhere on the web is a well known site of home-brew projects owned by a SM�, I think. Can't lay my hands on it right now. Anyway, as I recall he uses stereo headphones hooked to a couple of homemade op-amp filters, very simple affairs. One is a hi-pass and goes to one channel, the other is a low-pass and goes to the other, I think they must have fairly broad slopes that partially overlap. As you tune across a signal, it gradually "moves" from one ear, across your head to the other. This is how I recall it anyway. If I find it I'll post the URL.

Seems like in the most recent binaural in QST, the sig moved, say, R to L as you moved downward in AF, peaked in the L ear around say 750 Hz, and then returned to the R as you continued on down to zero-beat. (?) Does this sound correct?

> used up your max allowable yearly dose of radiation (5,000 millirems).
> That's the USA guideline, some countries set the bar much lower.

Remember that this is not a "whole body dose". Most of your body is a lot farther away from the meter than 6 inches. Radiation falls off as the square of distance; it gets weak fast. Most of your body is getting a lot less, even if you have your nose pressed right up within 6" of the meter.

The real danger with these old Radium dials is ingestion by breathing or eating small specks. Never, never, never(!) take one of these apart. After all these years, the Radium paint is friable; it flakes off into dust. If you inhale even a speck too small to see, or get some on your hands and later eat a Big Mac without washing, you can have a fleck of Radium lodged in your lungs or gut irradiating you for the next 2,000 years or so. This what we call in science "a bad thing". Leave it sealed up.

Phase reversal is not the way to get this effect. What you need is a low-pass filter to one ear and a high-pass response to the other with the corner frequency of both filters being equal, e.g. 1000Hz. Then 1000Hz signals seem to be in the middle of your head with higher freq's on oneside and lower freq's on the other.

This appears somewhere in the literature. Maybe "Ham Radio" in the 1970's.

Good luck, CATV has gone to coax because of using non-standard TV channels. I have never seen 300 ohm ladder line advertised. I've seen 450 ladder in a couple places. You might check with some rural TV repair shops; they might know of where to find that stuff. It is commonly used in deep fringe areas for TV reception because of the low loss.

FS an exceptional Hallicrafters Cyclone III, Model SR-400A, HF Transceiver plus matching PS-500A AC Power Supply and Sure 404C mic. The Transceiver has the
optional blower/fan to keep the finals cool and the original manual. Also included is a box
of 16 spare tubes, extra 6KD6s, 7059s, etc. This is the latest version
of the Cyclones with the 6KD6s rated at 550 watts input on SSB and 350 on CW. The transceiver is all original and has not seen much use. I am the second owner. It works
good and has full output. It probably could use some minor alignment. The finals are new. The paint is
all original and good, except for a few small spots that are peeling, a common problem with these radios. A little touch up paint and it would look new. This is a really nice one.
Price is $545 plus shipping from 79602. Thanks, Charlie Hugg, K5MBX

Hi y'all:

Does anybody have a copy of the schematics of the UNIDEN 8010 external
VFO for the UNIDEN 2020 transceiver?
I guess this is a boatanchor too (1975)?!

Regards, Ike

You have a bizarre sense of humor! CB Module? C'mon People are not that stupid if you trolling you better find another line.

The fact remains in anybodies language the transmitter has very poor 3RD order IMD. Maybe you think this funny and you willing to defend a company who turns out such a product. If you not familiar with transmitter 3rd order IMD i suggest you do some research.
Or better still look at the Radcomm review and see if that in your book is a good figure. It certainly is not.

Willy

Maybe you should read G3SEKs web page and learn something about IMD rather
than defending companies with lousy products. If you have a TS2000 maybe
you can tell us if Kenwood has improved the subsequent versions, you seem to
be in the "know"

SB-102 setup with SB-610 w/3.395 IF and cable and HP23A inside SB-600,
These all factory matching (later 70's) sugar blue faceplates, no dreaded
olive green.....they look beautiful.
Everything works, turner preamp desk mic.

The dial on the SB-102 has a hairline crack (barly noticeable and
stabilized)
I added a High Brightness green LED for dial illumination (less heat), lamp
sockets are still there.
Pinch drive is 100% fine and super smooth, low use set full power on all
bands, new 6146B's.
Could use that meter zero pot and 100ks on IF board soon.
Take all $400, would consider splitting up
Long Island

That mod would require the tank circuit to be modified and the input network too.

Double the tank coil, add a position on the band-switch, add capacitence to both C-1 & 2, Add a position on the input network band-switch, and build a 160mtr Pi-network for the input.

That's it, sounds simple doesn't it?
DO NOT try to use the amp "as-is" in the 80 mtr position on 160, you WILL burn it up.

HF Amps are my thing, it's what I do.
Build & repair them.

FS: Yaesu FT-102
Bought it on Ebay (got burnt) and it appears to have the dreaded relay problem.
The RX drops low every now and then- tap it and it comes back good and strong.
Tubes do full output. Front is nice, a few minor scratches on cabinet. Small
plastic cover on edge of carrying handle has a small crack.
This one has the optional AM/FM unit and CW filter. $325 as-is.
Thanks!
Jim

Radio Shack sells 300 Ohm poly open wire line. It works fine. I have used it on several antennas. If you need the heavier gague for High Power then the stuff from the wireman site would be better.

Not everyone can afford inconel Blivot pins. Some of the cheap import ones made of soft copper have been known to go out of tune. Usually, this happens just before failure, and only under high polysombic stress, so it's just best to replace anyway. But you're right, he should know that.

I don't know what you guys are whining about. I've been fixing radios
for 27 years and never have run into a bad Blivot pin. Even the plastic
ones hold up well as long as they are from a non-smoking environment and
the knobs aren't forced.

3032. Help Please (Heathkit Repair) - I'm Begging, Guys

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-16 15:48:38 UTC
From: cathexis@your.haterols.com
Message-ID: <3bcc53c1.90899219@news.erols.com>
Source record: 48826

Greetings,

I'm really hoping someone can work with me to repair my Heathkit SA-2040 Tuner. Problem is (I think) stripped Roller Inductor. Knob and shaft turn but Roller Inductor doesn't or barely only and in 1 direction only. Sickening "crunchy" sounds from inside Inductor. I have manual, schematics and supps.

I have an MFJ 300W - rated tuner but there is NO comparison ! I love this Tuner, it tunes anything and I need it for my amp. Popping the cover and tuning by fingers is killing me. Please, please, pretty please!!
Can you help??

KG4JBM/ Andrew

P.S. You can have my Blivot Pin collection if you help. Includes the rare Viking Drop-Forged Blivot Pin -- only 3 in existence. --- Andrew

Source record: 48830

That's what I paid for this guy at a yard sale. I took it home, plugged it in, and turned it on. The dial light came on and the tubes glowed and after about 20 - 30 seconds of warm up time I could hear Glen Miller's "In the Mood" coming from the speaker (it was already tuned to the local oldies station). This is my first boatanchor and I love it. It is going in my (someday) library where I can listen to it and enjoy the estetics.

Now my questions. I have absolutely NO intension of selling this radio but I am very curious as to it's value. It is in good shape with some water stains on the top and for you people that know this particular model, the laminate that curves around the sides is cracking, not peeling but cracked from top to bottom. Other wise all the knobs are present and the dial is not faded or cracked or anything. except for the water stains and the cracked sides it is a 10. Any ideas on the value.

I could refinish the top, but I have no idea on what to do with the sides. Any one know how to fix the cracks without having to rip up the old laminate and lay it back new?

Thanks for any help,

Rick KC0GIX

You got a heck of a deal. Just don't call it a boatanchor. :-)
Depends on *how* the sides are cracked...Re-veneering isn't all that
difficult. Feel welcome to drop by rec.antiques.radio+phono and The
Forum at http://www.antiqueradios.com
The Bunis Guide from a few years ago puts the value at $100-125. I'd
say more these days.

If that's the only problem, why not glue the roller to the shaft with JB Weld, or Bondo. I'm not familiar with this particular tuner, but that's a fix I've used in similar situations. You won't be able to disassemble it after the fix, but so what?

This coming Sunday.... The seasons last....

*** !!!! In our Traditional GARAGE and lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday October 21st 2001
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Discounts

A sellers discount season pass is available which
offers a 33% discount. See the advanced registration
form below for full seller info.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all

sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)

I thought about something similar 'cause I've noticed you can actually
slide the shaft in and out about a 1/4 inch of Roller so assume it's stripped.
What are JB Weld and Bondo ? Shaft is metal, roller base is I think plastic.
If they are "thin" I could try slipping shaft out a 1/4" coating with
glue-stuff and sliding back in. Is this the general idea ?? (And Thx. too!)

Jim...
Unless the seller said they were replaced, they ALL have the 'dreaded relay problem'
I changed them in my FT102 myself.
It is very easy.
There is a web site that spells it out, have you investigated replacing them?
I got all the relays from Mouser, except for one which I got from Yaesu.

Source record: 48840

An very elderly friend, who is highly expert at '20's gear restoration but knows nothing about later stuff & hates black wrinkled metal things<BG>, was given a very ratty but complete FB-7 rcvr (meaning, it looks like rats may have lived in it & may even return, as we who do this stuff will understand). No doghouse or spare coils, and he may still be able to find the 80 coils that arrived with it. Before I found him, he had partly cannibalized a few resistors out of it, thinking the thing to be a useless POS. :-) It is still filthy but if you're into ancient National projects, do you want it for a reasonable contribution to this old man who has done a very great deal for other radio hobbyists for decades (until he f*cked up a dirty FB-7<hee-hee>). It's in Maine & Mailboxes would have to pack/ship it to you. He has no email.

RSVP/Rgds,
- f.

3047. Mystery transformer

Message-ID: <3BCCB937.13FF3992@visi.com>
Source record: 48841

Howdy gang,
I have a small transformer that I am clueless as to it's function.
I'm hoping that someone may be able to provide some info. Here is a
description:

Size about 1 3/4" on a side.
it has 6 leads. Two (yellow) exit out one side of the core.
The other four exit the other side in two groups.
One set is a black wire and a yellow wire with a black stripe.
The other pair is red wire with a black stripe and a green wire with a
black stripe.

Any ideas what this is?

Thanks!

I just had to share this cool trick.

I had a Swan 350A with a warped VFO dial. To fix it, I scanned in the old dial, then used Adobe Photoshop to clean up the artwork. Then I used a CD labeling system to print one of those donut-shaped CD labels with the markings on it. The label I then affixed to one of those transparent clear plastic phony CDs that are often found on the tops and bottoms of CD-R packages. Looks and works as good as the original and costs nothing!

J-B weld is epoxy sold at automotive repair parts dealers, Bondo is two
part plastic filler for auto body work.

3057. FS New Diode Boards for Collins 30L-1

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-17 03:38:05 UTC
From: dw130@aol.comspamfree
Message-ID: <20011016233805.02150.00000200@mb-ms.aol.com>
Source record: 48751

I have for sale newly manufactured diode boards for the Collins 30L-1 amplifier. These boards are drop in replacements for the original. All components and traces are located exactly where they are on the original. All components and assembly are of the highest quality. If your 30L-1 has the original rectifier diodes in the power supply, you probably need one of these boards. Chances are very good that several of your original top-hat style rectifier diodes are shorted. Here is a very nice way to solve this problem entirely.

A photo of these boards can be seen at
http://members.aol.com/dw130/diodenew.jpg

If you would like one or more, they are $75 each + $5 shipping. Please send to:
Rod Murray (K1ROD)
17418 E. San Marcus Drive
Fountain Hills, AZ 85268

or I take Paypal @ using my address K1ROD@arrl.net

thanks es 73'

This is a nice set and as the other Bill states, it isn't all that hard to replace the veneer if it is too bad to repair. If you do decide to refinish the top stay away from modern poly finishes as they are not original to that era...use lacquers. If you plan on playing the set often it is also recommended you replace all the electrolytic filter and paper bypass and coupling capacitors. When you look under the chassis you will see a number of oblong Bakelite blocks filled with black tar, these contain the coupling and bypass caps. You can find how to rebuild these at http://members.aol.com/philcodata/capbuild.htm and also as Bill suggests visit the rec.antiques.radio+phono newsgroup for any help on restoration.

Regards,
Bill H.

Look a little closer, you will probably see a setscrew that tightens
the shaft to the roller, it may be difficult to get to where you can see
it. It will probably be a allen wrench type. **Tighten it**. Whoevcer
built it it probably undertightned it to start off.
The construction part of the manual should cover this.

FS 1200 watt Ultimite gas generator

Like new....used once to keep my furnace motor running during a black
out.
This generator was advertised in QST back in 1999 being good for field
days, etc.
Its very light compared to others in its class.
It list for $595.00.....but I am moving so its yours for $230 plus
shipping..
Check it out here: http://ultimite.com
Tnx Jack K8BVJ (since 1956)

May be audio or filament xfmr, or very light duty B+,
or something else don't have the imagination to see.

If you have an audio oscillator, you can hook it across one
winding to see if it peaks at 60 (or 50) Hz., or if it has
even response across the audio band. That'll also let you
determine the turns ratios. Power dissipation is an iffier
thing to determine.

Source record: 48771

Now three R-390A (Amelco, Stewart-Warner, and EAC), and an
R-1051B, with an R-1051H and an All-Collins Non-A R-390 due in
next week or so -- the 390 is a restoration by Rick Mish.

Two of the 390As Need Work, in capital letters, but all three
were freebies. I haven't lit the 1051B up yet, since it requires
a decidedly weird Navy-style power connector I don't have. Anyone
got 1051 power cords?

Must buy the lot and house next door, so I can tear the house
down and use the lot as an antenna farm. ;=)

Actually, it is a standard MS style connector. I got a set of all the connectors (minus the big honkin' one) from Allied about a year ago. The numbering system really isn't all that hard to figure out.

3082. TONO 7000 - any info please?

I am in need of a decent meter for my DX-60B
The one it has is non-original and quite unsightly.

Museum quality is NOT needed - scuffed up lens
or similar 'workable' units are fine as long as not
broken or cracked, and as long as they work!

Thank you,

Dave WB7AWK

Hammarlund HQ-180...this is a great operating radio, and only its size makes it necessary for me to part with it......condition is very nice, except one side of the cabinet has some rust spots on it, that we're there when I got the radio..could be touched up if the new owner found it necessary...also has spinner knobs on, instead of the original knobs...I thought that I would replace them when I got the radio, but it makes the radio so easy to tune, that I never bothered..you will see from the jpg-s that the face is very nice, with some slight paint flaking on the cast aluminum dial enclosure..a great working radio, and I believe it could be even hotter with a couple of new tubes...full set of jpg-s to interested parties....would prefer pick-up on Long Island, but if buyer pays for packing, will ship in CONUS.....$300.00 and O yes the clock works, as does the s-meter.....Bob....Please remove the (ns) from my adr, or just click on robco@optonline.net

3090. Recommendation for repair of HQ180A?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-18 02:34:11 UTC
From: flnocera@aol.comnotspam
Message-ID: <20011017223411.01643.00000565@mb-mm.aol.com>
Source record: 48784

I own a Hammarlund 180A that has sat idle in an air conditioned closet for about 7 years. When it went in, it worked great. I tried to fire it up tonight...sadly, only about half the tubes lit up, and there was a small current running thru the metal case, causing a slight shock. The fuse was ok. No noise from the speaker. None.

In the past I have restored many old all-American 5's, but the Hammarlund is way out of my league.

Can anyone give me a recommendation (and an e-mail address) of someone who is a Hammarlund repair expert? I'd like to get it restored and calibrated.

Thanks.

Frank Nocera

From: 106312.1035@compuserve.com
Message-ID: <3bcedc97.720725@news.compuserve.com>
Source record: 48694

I have just received an SP-600, plated US Sig Corp R-542/FRR

Unfortunatly, due to poor packing it arrived damaged, bent chassis, sides, smashed valves etc. It also appears to have had every component changed, so, its about as original as a $3 note. The mains tranny has been replaced with a poor example, a seperate heater tranny added, and the shaft coupler on the selectivity control is broke. Its also missing its case and a lower turret cover.

So, I'm looking for a replacement ht transformer, the metal lower turret cover, and a shaft coupler for the selectivity control (it looks smaller diameter than the standard 3/8, can anyone verify this ?)

If anyone can help, please get in touch direct.

cheers, Ben G4BXD

3106. FS/FT:Collins 30S1, 4CX1000A & Socket

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-18 19:42:39 UTC
From: "Joe Giacobello, K2XX" <k2xx@swva.net>
Message-ID: <3BCF30AF.F7830359@swva.net>
Source record: 48708

I am interested in selling or trading my 30S1 and some associated parts. I have owned it for about nine years and purchased it from K2BF (SK).

The 30S1 is S/N 678 (WE) and is in good condition. There are some mild scratches on the top and sides and there is a minor dent on the wire cage covering the air vent at the rear. The front panel is extremely clean and unmarred.

The unit has been modified to deliver 1500 watts output on all bands including the WARC bands (100 watts input). This modification was accomplished by the well-documented procedure of increasing the screen voltage through the addition of additional windings to the secondary of the screen supply transformer by means of a second (isolation) transformer. It is easily reversed by merely loosening several screws and removing the second transformer's leads from the main transformer's terminal strip.

The original three-minute time delay relay has been replaced by a homebrew unit which works flawlessly. (I have two nonworking original relay units also.) The bias transformer was replaced (or rewound and replaced) about six years ago. One or two of the original cartridge-type diodes have been replaced with more modern wire lead units. The HV rectifier tubes have been replaced by solid-state plug-in modules. When I took the amplifier off the air about five weeks ago, it was working perfectly.

I am also including in the package a spare, unused 4CX1000A and socket. The tube is an Eimac reject which was given to me by a good friend. It was rejected for cosmetic reasons and not performance. I have not checked it. If it should turn out to be NG, I will return $150 to the buyer.

In addition, I have a file on the 30S1 which includes many good articles and tips, a copy of an early manual and an original more recent manual.

I would trade the entire package above for a clean, working, modern 1.5 KW output amp. The TenTec Titan 425 would be ideal, but others are certainly acceptable. If necessary, unequal trade conditions can be adjusted with cash. Otherwise, the price is $1,600 with a pick-up in southwestern Virginia, about 40 miles southwest of Roanoke.

You can contact me via e-mail or anytime at 540-745-6825.

73, Joe

Racal RA17C-2 shortwave radio. 23 tubes. Complete with cabinet. Not working. Would like to trade for either an RCA AR88D or a No.19 set with PSU. These must be cosmetically good, electrically do not have to work but cannot be butchered.

From: Brian Denley <bdenley@mediaone.net>
Message-ID: <4jMz7.132351$vq.29815025@typhoon.ne.mediaone.net>
Source record: 48710

I posted a question last week on the screw size used by Hallicrafters for the SX-28 bakelite panel covers (the ones that cover the s-meter, tuning and bandspread windows). No one answered but I had them measured and It turns out that they are 4-36. I work for a large aerospace and defense firm but they have no such screws available. Luckily for me, a friend is going to make me a few so I am all set but does anyone know a website where these might be found? It might be handy for future reference.
Thanks

Go down to your local bolt supplier. Check the Yellow Pages for them.
We have a local distributor "Prime Fastener" and I've been able for find
virtually any size in SS, but not in Aluminum.

It sounds as if your 4-36 is NC. 4-40 NF is the most common.
Either should be readily available from most nut and bolt suppliers.

Roger:
4-40 will only go in about one thread before it binds. The Hallicrafter pitch is definitely less than 40/in. We measured it at 36. We found a old thread gauge for 4-36 and it goes in nicely.

I wasn't suggesting that you should try the 4-40 <:-))
Only that 4-40 is the more common today and you should be able to find the
4-36 at one of the bolt specialty companies. There is usually one near, or
in, most larger cities.

As Bill said, You need a bigger wrench to get the 4-40 to go in. Helps if
the chassis is aluminum <:-))

Modern Pacific Rim Quality Controls have minimized this practice. The
poor nut would likely strip itself (but may rethread) in a quarter turn
when confronted by an 'honest-ta-gawd' 1940s 'Merkin bolt made out of
'Merkin metal. Not to mention the Modern Pacific Rim Tool that would
give way when you tried to do it.
:-)

-Bill

I think that the 4-36 is common for most meter mounting screws. Never seem to be able to find a nut that fits when one is lost. I used a 4-40 and re cut it with a 4-36 tap. Worked fine.

3136. FS -- Collins 75A3 Receiver --

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-19 18:08:24 UTC
From: John P Russo <jprusso@acsu.buffalo.edu>
Message-ID: <3BD06C18.AAF6C7DA@acsu.buffalo.edu>
Source record: 48730

For Sale -- Collins 75A3 receiver with original manual and built-in Collins 100Kc calibrator. Comes with 3.1Kc mechanical filter. Front panel and knobs very nice, cabinet in fair-good condition. Receiver is in working condition but could use an alignment or a tube or two to obtain top performance. Has 6DC6 front end conversion upgrade.

Pickup only in Western NY area.

Pictures are available.

Priced at $350 or trade for modern, high quality receiver.

John KF2JQ

I know, they are a POS made in the mid 70's for the IC-21A but I would like to find one that can be modded for the lower 2 megs (144 to 146) for a project. Let me know what you have hiding the closets!
Even non working ones which is their usual mode anyhow!! I'm located In Denton Tx just north of Dallas. fred-palmer@msn.com

4-36 is classified as an NS thread. No idea what the 'S' signifies.
NC is national coarse, NF is national fine. This info comes from a
wall chart in our machine shop. It's such an obscure thread that none
of the machinists can tell me what it stands for!

3139. Pix of R-1051B underside

Newsgroup: rec.radio.amateur.boatanchors

I had seen people writing about how strange a beast the R-1051 is, with all its gears, chains, and motors. I put it all down to the ongoing "_My_ receiver's (weirder, bigger, heavier, more sensitive, etc.) than yours, nyah, nyah!" DSW in this and other fora.

This lasted until I got an R-1051B. It is a _strange_ beast, with no bandwidth or other selectivity control at all. Just mode, frequency, gain, and BFO. Two switches for the line level meters. That's it. Your basic receiver, except that it does FSK and ISB as well as U/LSB, AM, and CW.

But the 10- and 1-MHz knobs control _motors_ that make things happen deep in the bowels of the machinery and mass of wiring. The 100-, 10-, and 1-KHz knobs turn gears that turn shafts that drive roller chains that turn things in other places in the bowels of the machinery.

Turn this one, it goes "CLUNK_!" Turn that one, a motor whirrs, and then things go "_CLUNK_!"

Very strange and different, very stable, obviously a fire-and-forget receiver for continuous HF links like Fleet Broadcast.

Pics of mine are at <http://mikea.ath.cx/R-1051>, including pics of the underside -- the only ones I know of on the web..

Hammarlund HQ-180...this is a great operating radio, and only its size
makes it necessary for me to part with it......condition is very nice,
except one side of the cabinet has some rust spots on it, that we're
there when I got the radio..could be touched up if the new owner found
it necessary...also has spinner knobs on, instead of the original
knobs...I thought that I would replace them when I got the radio, but
it makes the radio so easy to tune, that I never bothered..you will
see from the jpg-s that the face is very nice, with some slight paint
flaking on the cast aluminum dial enclosure..a great working radio,
and I believe it could be even hotter with a couple of new
tubes...full set of jpg-s to interested parties....would prefer
pick-up on Long Island, but if buyer pays for packing, will ship in
CONUS.....$300.00 and O yes the clock works, as does the
s-meter.....Bob....Please remove the (ns) from my adr, or just
click on robco@optonline.net

Hello Folks,
I have the following for sale

Sams Photofact "Audio amplifiers an associated equipment"

Volumes 3, 4, 5. These are from the mid 50's and feature diagram's
parts list, dial restringing instructions, tube pin outs and all the sort of
stuff one would need to repair
audio equipment of the period. Scott, Mac, Hallicrafters, Knight, Masco,
Bogen, Stromberg etc.

The bindings are strong and there are no loose pages. I scanned through it
and all was clear and readable.
The only thing is the front covers are missing and edges of the pages are
yellowed.

Good solid American radios!!!

Best offer plus shipping

Thank you
Paulc

Hammarlund HQ-180...this is a great operating radio, and only its size
makes it necessary for me to part with it......condition is very nice,
except one side of the cabinet has some rust spots on it, that we're
there when I got the radio..could be touched up if the new owner found
it necessary...also has spinner knobs on, instead of the original
knobs...I thought that I would replace them when I got the radio, but
it makes the radio so easy to tune, that I never bothered..you will
see from the jpg-s that the face is very nice, with some slight paint
flaking on the cast aluminum dial enclosure..a great working radio,
and I believe it could be even hotter with a couple of new
tubes...full set of jpg-s to interested parties....would prefer
pick-up on Long Island, but if buyer pays for packing, will ship in
CONUS.....$300.00 and O yes the clock works, as does the
s-meter.....Bob....Please remove the (ns) from my adr, or just
click on robco@optonline.net

My dad, who served on PT-boats in the Pacific, told me that the Navy brass had them drop tools and equipment into the Pacific from various Naval bases -- 'cause they wanted to create work at home after the war.

Sounds like the logic (false) which suggests that war is good for the economy. If this were true, breaking all the windows in the US would also be good for the economy.

3164. Hallicrafters SX-62A alignment... HELP!!!

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-20 19:31:48 UTC
From: Mike Garber <mgarber@wi.rr.com>
Message-ID: <EikA7.204530$ME2.27564004@typhoon.kc.rr.com>
Source record: 48556
Cross-posted to: rec.radio.amateur.boatanchors,rec.antiques.radio+phono

Everyone sez to follow the instructions to the letter, but.....

And I quote (parenthetical comments are mine):

"Set the SELECTIVITY control at CRYSTAL/BROAD. While Slowly turning Slug S10 (of the 1st IF xfmr where the xtal filter is) in one direction across the resonant setting obtained above (peaking the IF stages), "rock" the signal generator tuning and observe the dip in the output meter reading as the adjustment passes thru the resonance of the crystal filter."

OK. Just exactly which adjustment is being refered to in that last sentence?? The sig gen, obviously(?), as I see the dip as a function of frequency. I dont see it with the S10 adjustment. But it continues:

"The correct setting of Slug S10 is in the center of the observed dip".

OK. Im lost. I notice that the shape of the null/2 peaks changes with S10 adjustment (from highly asymetrical to nearly symetrical). So WHERE is the correct setting of S10??

But wait, theres more:

"Set the signal generator at the weaker of the two reponses obtained on either side of zero beat and adjust the crytstal phasing trimmer C57 for the null"

Let me guess... Set the signal generator at the weaker of the two peaks obtained on either side of the null and adjust the crytstal phasing trimmer C57 to maximize the null depth (minimize the signal). Am I even close? I didnt think so.

BUT!!!!! If S10 is capable of varying the symetry of the notch, as observed above, there may not be a "weaker of the two reponses.

Please help me,
There's a whole World of news goin on out there,
Thanks in advance,

Mike Garber

PS. The dial restringing, and the recap job went just fine.

3166. FOR SALE: Yaesu HF Radios

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-20 19:52:04 UTC
From: SideValve <sabbatai_zvi@NOSPAMhotmail.com>
Message-ID: <9bl3tt0f1k3pbf26j77eu7ukphd5vio56b@4ax.com>
Source record: 48558
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

For sale:

Yaesu FT-101EX HF transceiver. 260 watts p.e.p. SSB, 200 watts CW,
40 watts AM on 160 through 10m plus WWV, AUX, NB, VOX, CAL etc.
Radio comes with the AC power cord, manual, microphone all ready to
plug and play.

I made several QSOs on the rig today and it works fine. The function
switch needs a squirt of cleaner, but everything else is solid.
Will sell for $265.00 plus shipping

Also have a parts rig FT-101E (includes additional speech processor
and 12V power supply built-in) - case is a bit rusty, but rig is
complete and would make a great restoration project or spare parts rig
for the FT-101EX above.
Will sell for $100.00 plus shipping

3167. Re: Hallicrafters SX-62A alignment... HELP!!!

Newsgroup: rec.radio.amateur.boatanchors

Source record: 48560
Cross-posted to: rec.radio.amateur.boatanchors,rec.antiques.radio+phono

Mike:

I am not familiar with the specifics of the SX-62, but the goal of the crystal filter alignment is to produce a tunable notch (assuming there is a "phasing" control or some such on the front panel) which is centered in the passband when the front panel control is centered. The slug you are adjusting appears to principally affect the coupling between the transformer and crystal, and I would adjust it for deepest notch, and as symmetrical as possible. Having worked with instruction manual writers, I can attest that their version of the truth isn't always engineering facts.

Message-ID: <ehm3tt4r2n46p9vhpau9piu0jonhii7a4a@4ax.com>
Source record: 48561

For Sale:

Set of three plug in coils.

1) This is a BUD 4 pin "ribbed" coil form, brown, 1" diameter 2.25" tall.
It currently has about 90 turns of close spaced cotton covered wire with a center tap.

2) Stout 4 pin ceramic coil form 1.5" diameter, 2.5" tall. Has about 50 turns of cotton covered wire with a 3 taps. One is also connected to the base.

3) The last one is from Vintage radio Kit Company, and is designed for their CPCW5 transmitter, as the final tank used with a 6AQ5 on 80 meters. It is an octal base
and stands 3.75" tall. When you could still get them, these sold for $8.00

I will sell all three for $18.00 plus shipping

Source record: 48567

Does anyone have any experience with replacing meter/dial lamps with LEDs? I've got a Kenwood TS-520 and TS-520S that need new bulbs - but the place that the Kenwood website sends you to for replacement parts wants $5.25 EACH! I might be wrong, but $42.00 (plus shipping and fondeling) for 8 little bulbs that don't last all that long doesn't seem like a deal to me. And, replacing the incandescent bulbs with LEDs seem to have another set of problems - color, intensity, and the angle that light is transmitted.

The Kenwood service manual says the specs are 12V-AC 40mA. The Mouser catalog has some incandescent lamps rated at 12V .040A and 12V .060A - for a little over $1.00! Would these work?

TNX for any help you can give me on this.

Michael - KD5BBC

Source record: 48583

Yep, I done many Heathkit SB radios that way also Guitars
http://www.esh-basses.com/siteneu/simsled.htm
The dials were cooking up and cracking.
Make them in cluster's of 3 high brightness wide angle LED's
(9 LED's)
You need to male a small half wave rectifier circuit and dropping resistor,
solder cluster right across lamp socket.

To go with blue LED's Buy 20 LED's then current match them and wire the
clusters in series.
The trick is to match and wire them in series....Individual dropping
resistors gets to big and bulky.
jOE

Rat Shack has 12v, 60 ma bulbs that will work. If you don't have access
to RS, let me know and I'll pick some up and send them to you. I have no
experience with using led's for replacement lamps, but I'll look into
it, I see no reason they won't work other than the light beam focus.

> Everyone sez to follow the instructions to the letter, but.....
>

Mike: You are not alone! The alignment instructions are very fuzzy. I also have the SAMS for the SX-62 and it reads the same way. The SX-42 uses the same chassis as the SX-62 but has a front-panel phasing control but is otherwise the same. The SX-42 manual has the same confusing alignment instructions. To make matters worse, many of the crystals in the SX-62/SX-42 receivers are bad. For the record, the SX-42, SX-62, SX-62A, and SX-62B all use the same crystal filter circuit.

The goal of this alignment is to get the IF transformers peaked at the crystal frequency and the phasing adjustment set to produce "single-signal CW reception." Note that this whole procedure is done with the BFO "on" and set for a 1 kHz beat note with the signal generator set at the IF peak. There are two settings of the signal generator that will produce a 1-kHz note. One of these settings corresponds to the IF peak. The other setting (for the 1-kHz note) will be off the IF peak and will be weaker. That is the "peak" you want to null with the phasing adjustment.

If you aren't up-to-speed on single-signal CW reception and crystal filter theory, get your hands on a ARRL Radio Amateur's Handbook from the 1950s or 1960s. After reading the pertinent chapters in the Handbook you will have a better shot of getting the crystal filter aligned. You really need to understand how this thing works to align it correctly. The material given by Hallicrafters in their instuctions is a terrible example of technical writing.

Best Regards,

Ed

That is common with a new water pump. Auto water pumps should never pump just water, but a water and antifreeze mix, which lubricates the pump.

Help anyone?

I am looking for information on a small Lagear ATU unit type LA1-B.

This has a tapped permeability-tuned inductor with adjuster knob, a tap selector switch, UHF83/SO239 coax input socket and single wire terminal output.

As there is no capacitor inside, I guess it is an impedance transformation device rather than a resonant ATU type??

Does anyone recognise this unit and know the frequency range, original application or any other info?

Thanks

Expert here...or at least experience. I had to put on some new air pump
kinda gadget and my replacement turned by hand like an old fan picked up
out of somebody's garbage. Its been two years now and its still
working.
There's a helluva lot of hp behind the wizardry of modern engines. My
inclination is to oil the appurtanences a bit and they seem to last
forever.

3201. Army R-174/URR general-coverage receiver?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-21 23:12:07 UTC
From: Phil Nelson <philnelson@antiqueradio.org>
Message-ID: <4BIA7.88344$aW5.1076556@dfw-read.news.verio.net>
Source record: 48645
Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.boatanchors

OK, I'm not really into military stuff, but I drove four hours to a mediocre auction and had to come home with SOMETHING besides a junkbox of parts and a $1 test instrument -:)

This set appears to be a R-174/URR military general-coverage receiver, with PP-308 power supply and CY-615 cabinet. You can see pics at:

http://antiqueradio.org/art/usar174urr01.jpg
http://antiqueradio.org/art/usar174urr02.jpg

Coverage is in 4 bands, from 1.5 - 18 mhz. It has manual or preset tuning, bandspread, an antenna trimmer, and built-in speaker. It appears to run on 115vac (50/60 cps), 6/12/24vdc, or dry batteries. Dimensions are roughly 14 inches high, 12 wide, 10 deep.

Given the power-supply options, I guess this was designed to be used just about anywhere. Haven't cracked the case yet to see what's inside, but I assume it has maybe ten tubes.

This is the first general-coverage military set I've seen that I was physical able to carry out to the car. Plus, with way too many "civilian" boatanchors in the house, I thought it would be fun to try something different. Oh -- the price was right, too: $26.

Would appreciate pointers to any schematic, restoration tips, and info about when/how this was used. On the bottom of the case is a date stamp Sep. 4 1959, which suggests that these might have seen duty in early Vietnam years.

Thanks!

I always replace light bulbs with LEDs; the results have always been good. It doesn't matter whether you have AC or DC for the source; the LEDs don't care. Now, if you want to use light bulbs..............if you use bulbs that are rated at about 20% higher, the life is much longer.

I have for sale, two (2) Amperex 4-400A tubes, never used...one box has never been unsealed.

These are the ceramic plate jobs, crystal clear, never installed. These tubes are very versitile and can be used as modulators or finals. I'm told that WRL Globe King transmitters actually put out more power with Amperex than any other 4-400.

Money back guarantee if not perfect. Answer quickly, 'cause these aren't going to last long.

$150 each plus shipping from Minneapolis.
Buy the pair and I'll pay the shipping.

Larry, N0XB
Northfield, MN
n0xb@arrl.net

3218. antique radio page - update

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-22 16:17:43 UTC
From: w8mmq@NOSPAM.email.com
Message-ID: <3bd446a2$0$35619$272ea4a1@news.execpc.com>
Source record: 48662

Due to ongoing technical problems with w8mmq.com, I have moved my Antique Radio Page to QSL.Net. Please make a note of the change in your bookmarks and web site links:

W8MMQ Antique Radio Page
http://www.qsl.net/w8mmq/

Many thanks to QSL.Net for freely hosting amateur radio web pages.

The domain name w8mmq.com will no longer be used, as these problems cannot be resolved. So please make note of the change. The Radio Mods section will be restored on QSL.Net as soon as possible.

Thanks
Dan, W8MMQ

In hope of saving someone from the confusion I found myself wading through, I'm posting the Allied Electronics and Amphenol stock numbers and nomenclature for the audio and power connectors on the "B" (and probably all other) R-1051.

Yes, it is _too_ a boatanchor. It weighs in at 70 pounds and it has two tubes.

No guarantees yet; I don't have my order from Allied. But here's what I ordered, with a tip of the hat to Jerry McCarty. Before you order, you need to wade through the catalog pages to make sure you're getting what you think you need. This stuff isn't inexpensive.

Allied Amphenol Name (what I'm using it for)
605-4030 97-3106A-16S-5S power plug, three-pin
714-2506 97-3067-1008 cable clamp
714-2582 97-79-513-8 boot, .437" O.D. cable
714-2581 97-79-513-6 boot, .312" O.D. cable

714-4004 97-3106A-10SL-4S audio plug, 2-pin
714-2502 97-3057-1004 cable clamp
714-2579 97-79-53-3 boot, .220" O.D. cable
714-2580 97-79-53-4 boot, .130" O.D. cable

Okay - so it's not a boat anchor - it's just a fishing weight ....

Need RadioShack HTA-20 2-meter amp schematics or service manual with schematics. Bought one when they went on closeout a couple of years ago but just stuck it up in the closet without testing it out. Gave it to my son a couple of weeks ago and discovered that I bought one off the shelf that was broken! Opened it up and it looks like it was soldered by a blind monkey having DT's while on a bad acid trip!

I have one set like this, but in a sorry state...It has been demolished by
government.
By using a hammer at the tuning scale, so badly
that the tuning cap has been shifted inwards by at least half an inch..
(They followed the U.S. rules well: 'Smash, cut cords...destroy _everything_
Use machetes, pickaxes etc'...as written on the classic poster..)
Well, it's all there and they only smashed the dial in..
I have disassembled the front and chassis and have straightened them,
but the dial mechanism is lost. Does anyone have a complete dial mechanism
and maybe a tuning capacitor for my receiver, which has been sitting
as parts in a box many years now?
Please e-mail me if you has one to sell me.
I might also offer it as a parts' source.

Stein

I'm about to get into the project of setting the low end of a PTO on one of my R-390As. I've pulled the front panel and the PTO, removed the nut covering the tuning screw, and replaced panel and PTO. It's heating now.

The books specify a non-metallic tuning tool. What are people using out there in UseNetLand?

I'm faced with a stack of R-390As I need to get in working order
to satisfy my own desires, and possibly to turn one loose upon
an otherwise-unsuspecting community. <vbseg>

But I'm having the Devil's grandmother's own time trying to find
some faults because I don't have tube extenders so that I can
inject signals, measure voltages, etc. while the critters are
running.

Anyone know where I can get 7- and 9-pin (probably Pomona brand)
tube extenders? And, so I can get some older stuff running, an
octal extender just to round the set off ?

You're welcome; glad to be of help, and Jerry really gets the
credit; all I did was weed out connectors for another critter
from the Allied invoice he scanned and sent me.

And _yes_! They work. You may want to order only the larger
boot in each set, or you may want both. They're less than
$1 each, but some might be just as happy with only the one
bootbetween the clamp and the actual wiring.

3256. HCRA Auction - 11/2 - Feeding Hills, MA

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-24 02:53:36 UTC
From: Jim <jmullen@rockys.com>
Message-ID: <3bd62980$1_1@corp.newsgroups.com>
Source record: 48600

One of New England's Largest Auctions coming soon.

Don't miss this year's auction, it promises to be one of the best.
We've got a lot of donations coming this year that will really make it
exciting - lab test equipment, Viking II for parts, CB's, Tec scopes,
repair lab equipment and a Henry 2K are rumored to be there.

Entry is free for everyone, you need not be a club member. The HCRA asks for
10% up
to $100 dollars selling price, everything after that is yours.
Mark all items clearly with your name, call and minimum bid if you're
selling, just bring
money if you're buying!

We typically get over 100 buyers and sellers, so come early for a good seat.

This year's raffle prize is a Kenwood TH-F6A and can be your's for a $1
ticket!

Great parking, super raffle prize and coffee & donuts.

The auctions sets up at 6:30 PM and starts promptly at 7:30.

HCRA Annual Auction
November 2nd, 2001
Feeding Hills Congregational Church
21 North Westfield Street
Feeding Hills, MA 01030

More information and a map for directions can be found on our web page at:
http://www.hcra.org/auction.htm

Thanks & '73...

Hello,

I have a defect in a military Larkspur C42/C42 set power supply and I'm looking for the schematics of this unit.

The unit is labeled Supply Unit Vibratory No 12, 24V input, ZA43208.

More common is the No12 MK2 ZA50544 of which I have schematics but the two units are too different to use the MK2 schematics for the repair.

Kind regards,

Nico PA3ESA

Socket extenders are pretty hard to find these days.You can, however usually find standard tube sockets. Here's how I make my own extenders: Take a tube with the base pattern you want and set it in a paper cup trimmed so it's only 3/4" high. Melt some paraffin wax (carefully) and pour it in the cup until it comes up about 1/4" above the bottom of the tube. Wait for the wax to dry, then carefully remove the tube. Straighten some bare wire by clamping one end and pulling on the other. The size of the wire depends on the type of tube - #18 for 7 and 9 pins miniatures. Cut the straightened wire into 1-1/2" lengths. Push the bare wires into the holes in the wax left by the tube pins. Fill the cavity left by the tube bottom with epoxy or polyester resin and let harden. Remove carefully from wax. You now have a plug. Bend the wires at the top about a quarter inch down to 90 degrees radiating outward from the center. (these are your test points) Solder the appropriate socket to the wires. (you may be able to place the test points through the holes in the socket) Your adaptor is finished.

Doug Moore

3267. RF Skin Effect

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-24 18:19:52 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <9r71mnbug6@neptunium.btinternet.com>
Source record: 48611

NOW AVAILABLE ** Small program "WIRESKIN.exe"

This simple program demonstrates the effects of the increasing resistance of copper conductors as frequency varies from DC up to 1GHz or more. As examples it computes performance of a straight round wire, an open-wire transmission line, of any sizes and dimensions, and a half-wave dipole. The effects of performance versus temperature are included.

See how fast the HF loss of balanced-pair lines increases as the wires get closer together and Zo decreases. Loss can be greater than coax.

Use the program to calculate the loss at speech frequencies of a 400-mile overhead phone line, London to Edinburgh.

Or of a twin 1" diameter, spaced 10 feet, 100 mile power transmission line at 60Hz. Did you know skin effect begins at power frequencies? Or compute loss of 100 feet of 75-ohm line at 21 MHz. Or calculate Q and bandwidth of a 1/2-wave dipole at 144 MHz. End-effect included.

As a sideline, convert kilometres to miles, mm to inches, or degrees Celsius to Fahrenheit. Or mm to AWG.

Only one file. 40 kilobytes. Not zipped up. Run immediately. Download WIRESKIN in a few seconds from site below.

Regards, Reg, G4FGQ

Hi All,

I'm hoping someone here will have/know the alinement procedure
for the Lincoln L-2754 6-Meter AM Transceiver. Maybe from
a Sams ?

tnx -n- 73 4 now,
b.a.

3279. FS: Three Power Transformers

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-25 10:42:35 UTC
From: SideValve <sabbatai_zvi@hotmail.com>
Message-ID: <80rfttki22eltl6ndrumkvhmb3ee0egrv0@4ax.com>
Source record: 48623

FOR SALE:

Tube type power transformers - NEW.

1) Raytheon TF15X02YY with 120V Primary.
Secondary is 1100V CT at 180 mA continuous.
Dimensions: 3" X 5.25" X 6.5" tall.
Potted, encased case with four mounting studs.
Will sell for $38.00 plus shipping

2) ADC Co. (AVCO-Crosley) model TF4SX03KA
Has 120V AC primary and two secondaries.
Sec A: 1050 V CT at 75 mA continuous
Sec B: 5V at 20 A continuous.
Will sell for $27.00 plus shipping

3) Also have a great filament transformer for that BIG final
amplifier:
115V / 230V primary.
Secondary is 7.5V CT at 51 Amps!
Brand new. Will sell for $95.00 plus shipping

Pictures available

3 pcs EF 14 Telefunken, NOS for sale. This can replace the extremely scarce VF 14 in the Neumann microphones. You will only have to change the heatervoltage. EF 14 needs 6.3V, but the VF 14 used 60V (Less in the Neumann mics)
You can find a picture of the valves at my web site: www.demostenes.no
The price is only $ 90.- each + shipping

Best regards,

Arnold Goks&#65533;yr
DEMOSTENES - N6899 Balestrand, Norway
Tlf. +47 5769 1340 Fax +47 5769 1267
http://www.demostenes.no

Thousands of different valves in stock as well as sockets,transformers,books,caps,resistors and other components. Web site is updated every week. You can order on-line.

3286. R-1051 line output levels

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-25 18:42:56 UTC
From: mikea@mikea.ath.cx

Source record: 48636
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

For sale - reply DIRECT to boatanchors@hotmail.com -

1. Ten-Tec Omni-D with matching DC power supply/spkr.
Looks great and works great EXCEPT: dial slips - sometimes
grabs sometimes doesn't; CW sidetone is raspy. Other than
that, it works perfectly in every way. Full output, full QSK,
hears everything, great SSB audio and CW note. $300

2. Hallicrafters SR-150 transceiver with matching power supply/
speaker. Looks and works great. Full output, awesome receive.
Very clean inside and out. $300

3. Hallicrafters SX-100. Mark I. Looks beautiful - very nice finish,
all original. Plays but is not well aligned. Bandspread dial cord is
starting to fray. I've had it sitting here for years just to look at
but will never get the time to align it. $250

4. Hallicrafters SX-99. A smokers delight :-) Already yellowed
with someone else's nicotine stains. Plays but needs alignment.
Straight, no mods or extra holes. Easy restoration, cuz most of
it's just cleaning. Alignment is easy on the S and SX-series, but I'll never
get around to it. Meter is good. $110

5. Hallicrafters S-85. Plays but not well. Looks ok, but has scratches
and some tiny spots of rust here and there (not on the face though).
Easy restoration. $75

6. Kenwood VFO-820 - matches the TS-820. I've never once actually
used it, so I just pulled it off my 820 last night. Works perfectly. Comes
with that goofy cable. $100

7. Heathkit HW-12 75 meter SSB yakbox. LESS power supply! Works
perfectly with lots of sensitivity and excellent SSB audio reports. This
silly thing works better than my TS-820 on 75. Missing the plastic
window that goes behind the dial cutout. About a 7 in appearance, but
a solid 9-10 in operation. $45

8. Drake TR-3 HF SSB transceiver. Works perfectly, with fresh finals.
Full output and sensitivity. DOES NOT have the power supply. I used
with the supply for my B-line. Very nice SSB rig. $200

More to come. I just did a major shack juggle, and this is all my gear
that is now surplus. You can see MUCH of it at www.boatanchors.com
click on 'the radios' and nose around the links. You'll see most of
what is describe.

ALL ITEMS ARE LESS SHIPPING!!!! I use USPS exclusively, but if
UPS is a must I can perhaps make it happen. Big stuff will be double
boxed as needed. Or pick up in Tacoma, Washington. I can drive
to Seattle or Chehalis if that helps. And it's all sold AS-IS with no
warranty implied. I've described it all as honestly as I know, and tried
to think of all the stuff I should. Beyond that, it's as-is. I MIGHT have
a manual or two, but I'll have to dig around and see. I can also email
photos of items to SERIOUS requests. I haven't taken any photos
yet, though.

I'll have more radios on the block soon.

Thanks,

Dave WB7AWK

Try feeding it to the AUX or TAPE input of a hi-fi/stereo

system. Typical line levels are *milliwatts*, not
enough for speakers.

Scientist were looking for a human brain to experiment on. They
were presented with the brains of engineers, doctors, lawyers,
accountants, construction workers, office workers, ect. They then
spied one labeled 'brain of a cber'. They said they would take
that one and when ask why on earth would they want that particular
one, the answer, "because we want one that has never been used."

YAESU Model AYC-221 Digital Display Unit.

For Yaesu FT-101 series radios. Displays your exact frequency to FIVE decimal places just like the modern all solid-state rigs.

Great little accessory and it works perfectly. Just plug it into the VFO accessory jack in the back of your FT-101, FT-101B, FT-101E, FT-101EX, FT-101EE, FT-101-F, FT-101FE (did I leave any out? he he)

This neat little gadget sits on top of your FT-101 series radio and lets you see exactly what frequency you are on. Has adjustable calibration so that you can set it precisely using WWV or a secondary crystal standard such as your rig's calibrator or any other signal source.

Dimensions 4.5" X 6.25" X 1.5"

Comes with the original cable so it will plug and play.

I believe that this might also work with the FT-221 Analog 2m allmode rig.

Will sell for $75.00 plus shipping

For sale:

Yaesu FT-101EX HF transceiver. 260 watts p.e.p. SSB, 200 watts CW,
40 watts AM on 160 through 10m plus WWV, AUX, NB, VOX, CAL etc.
Radio comes with the AC power cord, manual, microphone all ready to
plug and play.

I have made numerous QSOs on the rig and it works fine. The function
switch needs a squirt of cleaner, but everything else is solid.
Will sell for $265.00 plus shipping

Matching digital display available too, for an extra $765.00

3 pcs EF 14 Telefunken, NOS for sale. This valve is equivalent to the
extremely scarce and expensive VF 14 EXCEPT for the heatervoltage.
EF 14 needs 6.3V, but the VF 14 needs 60V (Some Neumann mics run the
valve on about 30V) The only thing you have to do is to alter the
heatercircuit in the powersupply of the microphone.
You can find a picture of the valves at my web site: www.demostenes.no
Just search for EF 14.
The price is only NOK 929.- each or about US$ 104.- + shipping.

Best regards,

Arnold Goks&#65533;yr

Kennedy Associates, 2618 Rigsby, San Antonio, TX is dispersing a 50 year collection of Tex Kennedy, W5QDB, today through Sunday. Not many cathedrals, but tons of tubes and test equipment. Military and commercial surplus. Used two-way antennas. Three large buildings full, mostly of two-way gear and antennas and coax. Worth a look if you are nearby and just want to see how much junque one person can collect in 50 years. Answer: Over 12 acre feet (2 acres 6 feet deep). Bring a flashlight. The Millen GDO low frequency coils are gone. I got 'em!

The chassis is copper plated and lacquered or otherwise protected when new.

Once the pitting has penetrated the protective layer and eaten into the copper plating you are out of luck. You can clean but if you try polishing you'll expose the plating where it isn't already eaten away and it'll be bright and shiny and look nothing like the original.

Unless one wants to completely disassemble and have the chassis replated I think it's best to clean and dry and live with it.

I'm not buying but that sounds like one helluva deal on the Swan.
Non-working ones with PS quite regularly sell for more. And I kinda
like the wide Swan audio! Its the people adjacent to the freq that
don't. :-)

Hello,

PC 900 is a B7G base triode with a heater of 3.9V 0.3A, Va is 135V
Vg -1V Ia=11mA Wa 2.2W Ik=20mA max, u=76 and the gm is 14.5mA/V
A very promising valve to experiment with in low-level stages, both
audio and HF/VHF amplification. It was developed for use in VHF and
UHF television tuners.
I have 400 pcs in stock and the price is only $ 3.00 each or $ 1.50
each if you buy 100 pcs or more. The valves are NOS, in mint
condition, original boxes and the label is Haltron, but they are
rebranded, and I think the are originally made by Philips or Siemens.
E-mail me if interested.

Best regards,

Arnold Goks yr

3329. Re: R-1051 line output levels

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-26 23:50:45 UTC
From: dharlan <dharlan@ameritech.net>
Message-ID: <3BD9F71A.2F065E54@ameritech.net>
Source record: 48523

Hey Mike,

My book says 60 mW out the back, BAL or UNBAL
600 ohm at 3% distortion. The headphone jacks are fed from a
tertiary winding on the same audio output Xfmr as the line jacks
and it is rated at 15 mW. FWIW an LS-474 speaker was supplied
with the 1051 for local monitoring and mine work fine from the
headphone jacks. Like Josh though I do run the line outs to
a nice stereo amp (Pioneer SX-950 !) for FABULOUS ISB audio.

According to the alignment part of the manual
it should easily make 10v rms with 1uV input with 30% AM MOD.

Try headphones into the front panel. That line
does not go through that WACKY flex cable to the case. If you cant
hear anything there, it could be that 100 ohm resistor (R47 ?) on the
AF modules. Replace with 1 watt job. Do your meters move ??
You can also transpose the 2 AF modules.

Good luck Mike, Please keep us posted, that
1051 is a "sick freak" of a radio and well worth doing whatever
it takes to get it running. WBCQ in ISB with a big amp and
speakers is the way to go with it.

3340. Value of Collins 32S1 ?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-27 14:06:55 UTC
From: k9sqg@aol.com
Message-ID: <20011027100655.26773.00000224@mb-bj.aol.com>
Source record: 48534

Have a Collins 32S1 in beautiful condition that I am considering selling. I was starting to assemble an S line so that I could say I owned some Collins gear before becoming a silent key, hi. Found out I couldn't afford to do that with the power supply alone selling for over $300 and speakers for close to $200. I'm going to keep the receiver but am considering selling the transmitter. Would appreciate opinions on the value of the transmitter. Not sure if I'll advertise here or Ebay.

Thanks for reading the posting.

73s,

Evan

3342. FS 624 kit..100hz marker generator

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-27 15:51:38 UTC
From: k8bvj@webtv.net
Message-ID: <6584-3BDAD80A-118@storefull-237.iap.bryant.webtv.net>
Source record: 48536

Here is the popular crystal calibrator/marker generator from the ARRL handbook as a kit which I never bothered building about 3 yrs ago..The kit includes PC board and all parts plus 100hz crystal.
The generator has marker outputs at 25hz, 50hz, and 100hz.
For all outputs you need your own selector switch but with just a 100hz output you dont. Runs on a 9volt battery

Great for any classic rcvr or what you....
Comes with full manual...

Need a picture let me know.. $25 plus shipping

3343. Drake SSR-1 Receiver FS

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-27 16:28:47 UTC
From: Bruce Stock <stockb@accessone.com>
Message-ID: <3hBC7.23450$ck.197659@sjc-read.news.verio.net>
Source record: 48537

This Drake SSR-1 receiver is in good condition cosmetically, and perfect condition electrically. It has good sensitivity on all ranges. It is a Wadley-loop type receiver, similar in general nature to the Yaesu FRG-7, but with better IF filters.

The battery box is pristine and the whip antenna is straight and strong. Comes with manual copy.

An excellent receiver for SWLing or listening to the ham bands. See picture at:

http://myweb.accessone.com/~stockb/misc/SSR1.jpg

$139 plus packing and shipping from Seattle.

73, Bruce AB7YD

I have in my possession a very dilapidated speech processor PCB, allegedly from a firm called Technical Associates (American?). Looking at the board it appears to be an elaborate audio compressor (possibly audio clipping as well).

Does anyone on the group know of the firm or better still have any data on the processor that would be enough to decide if it is worth resurrecting into working order.

Thanks - George G3VBE

no, I was referring to the 'standard sob story' so many newbies hear from
the 'old guys':

'Y'know, when I first learned Morse Code, we didn't have the luxury of
listening to it and writing it down letter by
letter.....nooooooooooooooooo......we had to memorize a full page and then
write it from scratch...........with a piece of charcoal from the wood fire
under the steam boiler that powered the generator to light the filaments in
the tubes.............we didn't even have paper to write it on, we had to
take a hatchet and chop pieces of wood reeeeeeeeaaallll
thin.............and you new guys think it's tough now????? Why, back in
the old days, we sometimes didn't have enough dots and dashes to go
around........some of us had to use 1's laid sideways.....................'

that kind of crap

3351. FS: German WWII field radio Torn Eb

Get yourself a Heathkit HP-23 powersupply and the SB-600 speaker console to house the power supply and with a modified power cord you can fire up the 32S-1 for a fraction of what the 516F-2 sells for. Shit, I would keep the S line together rather than break it up for a simple problem like the power supply. 73 de Fred...PS I will offer 200 dollars for the transmitter.

From: Lamb <k7fm@teleport.com>
Message-ID: <q_HC7.1538$655.101131@nntp3.onemain.com>
Source record: 48447

Hello Evan:

The 32S1 is probably worth at least $250 and possibly $300..

The 32S3 has some significant improvements - especially for cw so they are more desirable and sell for a lot more. But, I have an old 32S1 that have upgraded to have the features of the S3. Also built a home built power supply.

I also have the KWM2 and the KWM! and get those out from time to time. But, in truth, the S Line is probably better on the shelf to look at rather than to operate. The new gear is so good and inexpensive, although I am a sucker for the old gear.

Today I just finished working on an old Davco solid state receiver. It is basically a small solid state receiver that came out in 1960 very similar to the Collins 75S1.

It was not working and my friend sent it to me in January of 2000. The rf stage was a P channel fet that was not very good. I redesigned the stage using a N channel in a common gate configuration. But, gain was low. Finally got it running better than the factory ever dreamed. Have ten pages of notes.

But, it will be off the table soon and I can get on to other restorations. This was the longest restoration ever.

73, Colin K7FM

Source record: 48451

I don't normally do this (in fact, I have never posted a FS message here before), but . . .

I just got an email from a guy in Madrid who has a Collins 51-S-1 for sale. Rack mount, working, just realigned. No price suggested. He asked what would be fair, and I relayed what is stated in the Osterman shortwave guide (US$1100 - US$2100). If anyone is interested, let me know and I will send you his email address. I'd love to have one of those, but I'm way too cheap to pay shipping from Spain to the West Coast of the USA :-)

No interest in this transaction, just trying to help find a home for a nice receiver.

this is why amateur radio will die. period.

i swear, instead of putting people down, why not try and share
something, like amateur radio with them?

the little quotes below show the attitude of the majority of hams i have
met. "look at us. were better than you cause we passed a code test." that is
a crock of shit. in my brief life i have met more educated fools who have
paper showing what they know, but they are dumb as a box of rocks.

the reason most people don't join the ranks of amateur radio is NOT
because they are not interested in radio or want to operate illegally. it's
because most amateur radio operators treat all other radio operators like
shit.

i do not agree with illegal operation. i took and passed a 13 wpm code
test for my present license. all i'm saying is, give kindness to get
kindness and being humble will kill no one. let's build amateur radio, not
destroy it. because with attitudes like shown below, we will loose. one band
at the time.

my two cents.

Message-ID: <wKRC7.13638$jr.2123390@news1.rdc1.va.home.com>
Source record: 48458

This one appears to be NOS. Has the original Turner wire tie around the cord. Includes spec sheet and original warranty card. Not sure the age of this one, but probably from the 1960's??? That's just a guess, but probably close. It reminds me of the mics used on the Heathkit lunchbox rigs. However, as you can see in the pictures, it's a bit different.

Very nice shape. A few very minor scratches / imperfections, but very nice. $35 plus shipping. Sold as-is. Money order only. Please email if interested. Follow the links for some pictures.

3366. Valiant audio mods question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-28 11:22:28 UTC
From: Bill Russell <willy@global2000.net>
Message-ID: <t3qnttoveg4i46qne73u2mgd2b2fj64jsh@4ax.com>
Source record: 48460

Doing mods to my Valiant and need some MORE advice. Im going to use the mod from Electric Radio (A Valiant for the 21st Century, issue #137) that uses KT88's for modulators. As I listen on 75 to some of u quys with Valiants, I noticed some of u use 811A's instead of the KT88's. My question is where can I find more info on the 811 mod. Will they work with the existing iron and power supply and are they better than using the KT88's. Either way I hope to also add a reactor if I can find one. Any ideas or help would be great.
BTW, as of now Im only a tech so I cant join u guys on 75. By the time I finish the Valiant, I will have my general.
I also have a Thunderbolt but thats for another day!!!

Thanks in advance,
Bill KC2IFR

What's so bad about the audio out of the original 6146's?

Its a 2-way street. We held a novice class once and had a pretty good initial turnout. There was no putting anybody down but when the prequisites were being explained, one well known CBer (and his wife) stood up and uttered some vulgarities and walked out.
The class went on to graduate about a dozen new Novices (in a very small town) from ages 10 to 71 many (if not most) of which were former CBers. In fact one of our instructors was the king of local CB DX-ers before getting his ham license only about a year earlier and probably responsible for luring many to the class.
I'm sure the guy that stormed out wouldn't have been welcome anyway with such an attitude.

One thing is for sure, you can find 811A's a-plenty at better prices
than KT88s.

Sorry, Mike, that you feel that way. But the "Extra Light" is not as difficult an exam as the prior Extra. That doesn't make me "better'n" you, but it does mean that I and many, many others took a more difficult exam to reach the Extra class.

It wasn't harder, you say? Look at the license statistics and review the numbers on Techs and Generals and Advanced class licensees who upgraded as soon as the code requirement was watered down.

What I hear in your post, and so many others like it, is the cry of those who wanted the respect for themselves that was earned by the hams who came before them. So they waited until the requirement was lowered, and now wonder where the respect went.

Sorry, putting a pig in the palace doesn't make him the King.

I agree. To refute the difficulty level is usless. Go look at past license
manuals.

> the respect went.

I think there's more to it than just that. Consider some other similar
situations.

First, long ago (ya know, when my parents had to walk both ways to school
uphill in a snowstorm without any shoes....) driver's tests required a
standard transmission. I took my driver's test in 73, and did not need to
use a stick; in fact, it was not until 13 years later that I owned my first
car with a stick (and loved it....). OK, so my driver's test was easier
than my dad's -- does that make him a better driver than me, or vica versa?
No.

Second, when I earned my Instrument Rating, I had to perform NDB holds and
approaches. I believe they're dropped that from the flight syllabus these
days. So, does that make a new pilot any better or worse than me? No.

I don't think the problem is so much an easier exam, I think it has more to
do with attitude. I've observed that a lot of the newbies (regardless of
license class) are NOT interested in how radios work; they're NOT interested
in learning; they want to unbox that new 144 Mhz CB radio and start
talking, or unbox that new whiz bang DSP 500 memory HF rig and start
talking.

In short, they DON'T want to learn radios, antenna theory etc. They want to
be an applicance operator. Offend whom I may, but I will NOT respect this
kind of attitude.

On the other hand, there are a lot of newbies that WANT to learn how the radios work -- it's our jobs to Elmer them.

Maybe our licensing mechanism needs to be changed. We could follow the FAA way -- written exam first, then oral exam, then flight exam (practical exam in amateur radio'scase). Boy, I can hear them howling now.......

Here's a sad illustration on one of our "new" hams. This happened this year at field day. I was running the CW position and having a ball. Some of the newer hams were watching me, and I offered to let them run CW. One of them, in a very loud voice, yelled "I don't want anything to do with that dit-dit-dit-doo-doo stuff! "

Just some thoughts....

I have a Atlas 210X for sale. It has been used it in an RV for the past year and a half and gets good reports. It was operated in the RV on Field Day 2001 and made many contacts. Comes with mic, power cable and manual. Good, solid, well built, solid state transceiver. Good condition. Asking $200 plus $10
shipping. Will ship anywhere in US. Can accept Visa/MC. E-mail rdonahue10@home.com if you're interested.

If the U.S. were to place a broadcast transmitter that could hit all of Afghanistan on a common frequency, how much power would be required and at what frequency? I think their people could benefit from some American Culture on a constant basis. I'm serious here, I'm not just talking some crappy see through propoganda junk. Where did the old VOA transmitter from Mason Ohio end up????

I don't think you could. Afghanistan is pretty big...and mountainous.
I believe the airborne xmtr is on for about 8 hours a day and I can't
imagine how they are filling all those hours of programming. Sure its
propoganda but there has to be something else worth listening to or
people would simply ignore it.
If the mess ever ends, maybe a network of transmitters would do the
trick but I suspect they would get blown up fairly quickly by radical
elements.

Source record: 48480

i want it to be understood that i was not arguing test requirements. i believe they should have left that alone, to be honest with you. however it is hard to honestly argue that several people who have passed the old extra theory and code test are VERY poor operators. don't believe me? tune in 80 meters and check qrz for some of the callsigns you hear. it is sad to say the least. point being, just because you pass the test does not make you a better operator.

the point i was trying to make was for hams to make the attempt to convert the cb guys rather than slander them. i fully understand there will be people who use cb who will just not care about ham radio, as illistrated by the gentleman who described the class where the man and wife walked out. however, i bet that the majority would respond more favorably to, "hey, let me show you my station and how it works" than, "your a cb'er and your illegal and we have nothing else to say to you." know what i mean?

i am showing my age, but didn't they call it "winning of hearts and minds" in the vietnam era, or something like that?

the one and only point of my response to this post was "kindness turns away wrath."

thanks for the bandwidth.

This is a bag of sever assorted shock mount cushions. They are new
and the rubber is soft and flexible, $7.00 plus postage.

If interested please reply by e-mail.

Regards,

Michael

3394. FS: Military Fuses

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-29 02:45:52 UTC
From: mc@NOSPAM.sover.net
Message-ID: <3bdcc2df.62925605@news2.sover.net>
Source record: 48487

I have two boxes of fuses that look like military fuses. one is marked AMP30 @ 50 Volts the other is 15A. Fuses are 2" long, diameter is 1/2". There are 10 of the RFN-30 A fuses and 6 of the 15A. I don't need them so if anyone does they can have 'em for $5.00 plus postage. If interested please reply by e-mail.

Regards,

Michael

3395. FS: Millen Grid Dip Oscillator Plug-In Coils

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-29 02:45:57 UTC
From: mc@NOSPAM.sover.net
Message-ID: <3bdcc2e4.62930635@news2.sover.net>
Source record: 48488

I have a pair of coils that are used in the MILLEN Grid Dip Oscillator
(all models) that are surplus to my needs. These are:

A 1.7 to 4.5 Mcs
F 60 to 150 Mcs

They are very clean with no cracks or scratches.
$10.00 each plus postage.

If interested please reply by e-mail

73,

Michael Crestohl

Considering that most consumer radios are going to be MW or SW its moot because the ionosphere would block any signal transmitted from space.

Now if we want to drop DirecTV or Dish Network receivers on them, its a whole 'nuther story. I believe those transponders are in the 100-watt range with about 16 TV channels per transponder and therefore can be received on a dish small enough to mount on top of a tent :-)

If it "was harder before" as I guess you are implying, then how is it that all of those guys upgraded right after the 20wpm code was dropped? The written part was still exactly the same until some months latter.

A non ham instructor once told me that a "ham is the best part of a pigs ass"

Respect?? What respect. Taking a test does not buy you any respect. It is what you do after you get the license that counts. It is a continued learning trip. If anyone that has been licensed for any length of time still thinks that the test they took way back when was difficult then they haven't progressed any.

Respect? Just listen on the air for a few minutes on most any band. It doesn't matter the class of license or how long ago it was gotten. It is sometimes embarrassing to admit to being a ham.

8700 USB is what is being heard in the states. The other two are MW (864 and 1107 IIRC). There are something like two 4-hour transmissions...one in the morning and the other during afternoon/early evening Afghan time.
I've yet to hear a definitive answer about the actual location of 8700. Some say its in Turkey and is the link to the airborne MW transmitters. But it was listed along with the MW freqs on the fliers that have been dropped along with the non-ssb radios so go figure?!?!?

For every thousand people, the country only has 10 TVs and 73 radios. Even if we're dropping radios from bombers, in most parts of the country there's no place to plug them in, and with a per capita GDP of $800, they're not buying many batteries. (Maybe we're dropping the kind of radios you wind up for power?)

For sale, very good Gonset GSB100 transmitter. New power supply with Peter Dahl transformer. Front panel very good, 9+
Asking $325.00 and pictures available for the asking. This is a real nice transmitter that will look good on your desk. Plug it in, add a mic and be on the air. This one is easily in collectable condition.

I have a second one, not as nice looking. Works great! Asking $175.00
Picture can be seen by following my link on QRZ to my web page. Just go to K5VSE.
Both do not include shipping. Manuals included. Both have been on the air recently.

Andy adds:

Personally, after seeing the ranks swell for the last 20 years with appliance operators, the hobby seems to have evolved from a forum for radio enthusiasts who like to build their own equipment to something a lot more like the citizen band . I used to go to hamfests to buy parts and pieces . Now one buys microprocessor controlled technowhiz wonders that go obsolete as soon as the manufacturer stops making the special purpose ASICS inside.

(This just might have something to do with the interest in the DX-40s and SX-43s that are for sale on Ebay ---- these things can be kept working indefinitely....)

Anyway, I have my EXTRA (old rules) as a point of personal pride, and not as a demand for respect..... If you build your own equipment, we already respect each other. If you don't , well, maybe you ought to try it.....

For some, a license is just a "permit" to operate equipment that someone else designed and built.... For others, it is a way of legally testing out ideas that result in a product where the pride is the "pride of accomplishment", rather than the "pride of ownership".....

3417. Re: ILLEGLE CBERS

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-29 20:19:24 UTC
From: JB <ac6tk@nospamcybertime.net>
Message-ID: <9rkda2$lc0$1@madmax.keyway.net>
Source record: 48411

The theory behind the Novice test, was that it would allow
time for the newbie to promote the kind of operations
that would develope good operating habits and to develop
skills in the radio arts.

The power restriction, and low-speed code test and promotion
of CW operation in narrow sub-bands, all contributed to
developing care in observing frequency allocations and brevity
in communications, and weak signal skills, not to mention
requiring sufficient patience and attention span to pass the
simple 5 wpm code test.

The Tech license fails to promote weak signal HF CW ops
and thus promote skill building. At it's inception, the Tech
license allowed experimentation with frequencies that were
underutilized and it was thought that the skills required
would be comparable and indeed would require much
more technical expertise than the Novice ticket. However,
with the advent of the over-the-counter radio resembling
the channelized CB rig, the whole idea of incentive
licensing falls flat in promoting the radio art and good
operating skills.

Possibly with the realization that the CB operations would
be the real entry level training ground, that it would be left
up to operator to unlearn bad habits and "find" good
operating habits without necessarily learning from those
who have gone before. Given this fact, for what reason
do we have a licensing stucture at all? Although good
operating habits are not officially discouraged, one can
always unlearn bad habits and learn good ones but who
would hear or recognize them as the lids capture everyone's
attention and discourage others?

In fact there is no official promotion of good operating
habits other than the requirement of a quick test that
amounts to a list of rules to be broken.

It's a Miltronics (Rick Mish) restoration, and it is _awesome_.

It pulls in the hash in my shack, from all the computer gear and
all the wall-wart switching power supplies. Now I gotta put in a
real antenna.

It also, even over all the hash, pulls in some interesting sigs,
like R. Moscow (I think) at 2000Z, which is broad daylight here.

I forced myself to go back to work, 'cause I'm an hourly temp
now (I retired and then came back), and get no fringe bennies
at all.

But come tonight it's gonna be "turn the computers off and surf
the HF" time.

'Scuse me while wipe the drool off ... .

I have a non-A Miltronics all Motorola flavor. It is amazing how good
a 50 year old radio can be after Rick works his magic.

Being a ham, I have a good set of antenna arrays and there is nothing
like listening to distant AM broadcast stations using the 160 meter
inverted vee.

3433. Wanted: small HV power transformer

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-30 14:19:51 UTC
From: k5dh@raytheon.com
Message-ID: <bGyD7.4$284.95@dfw-service2.ext.raytheon.com>
Source record: 48427
Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Greetings, tube-gear fans...

I'm looking for a small HV power transformer:

Primary: 110 VAC

Secondary: 300 to 350 VAC center-tapped at 50 to 100 mA
--- OR ---
150 to 180 VAC without C.T. at 50 to 100 mA

Filament: 6.3 VAC at 2 to 3 A
--- OR ---
12.6 VAC center-tapped at 2 to 3 A

Size: No more than 2-1/2" W x 3" D x 3" H

The application is for the power supply in a homebrew 80m
and 40m tube-type VFO. After full-wave rectification and
some stiff filtering, I want to wind up with +200 to +250
VDC for the cathode follower and post-amp plate voltages,
and I'll use a VR tube to regulate the oscillator plate
voltage. I am very constrained on space in the cabinet
(which is why I specified that small of a physical size).
Anyone have something in that range that they can sell me?
Yes, I'm aware that Antique Electronic Supply and other
dealers sell new power transformers, but their cost is
astronomical. I'm trying to do this "on the cheap" with
all junkbox parts.

73,
Dean, K5DH

Dean,

You should be able to get 300V @ 100mA using a half wave voltage doubler and use a separate filament transformer. I'm not sure if you can fit it in your space, but breaking it up into two devices may help. The cost will probably be less, too. A couple of 150 uF@450V , a couple of diodes, a surge resistor, and a few bleeder resistors should do the trick.

I recently did this for a German tabletop radio I had bought with the transformer missing and it cost less than $15 including a Radio Shack pc board.

Consult most any electronics book or the Radio Amateur Handbook for a schematic, or email me and I'll send one along to you.

Good luck.

From: Me <me@nym.alias.net>
Message-ID: <7a9uttg6re6h8lfeuv4hlkitsbevn26jit@4ax.com>
Source record: 48433

This is the most popular AM filter for the Collins S-Line receivers. It is the F455FC60, 6.0 kHz bandwidth mechanical filter. Itï¿½s in perfect mechanical and electrical condition and will greatly enhance your 75S-3B or C receivers AM operation. 6 kHz is the ideal bandwidth for good fidelity and adjacent frequency splatter elimination. This filter is a drastic improvement over the stock dual IF can filters that are normally used for AM. Filter type and specs as follows: F 455 FC 60 6917 Part number: 526 9522 001 Buyer to pay with a money order or cashiers check. Thanks!

The power you want to handle is, approx.
Hi Voltage: 15 to 35 watts.
Filaments: 13 to 25 watts.
Total: 30 to 60 watts. First transformer.
Hi Voltage: 15 to 35 watts. Second transformer.
Was going to suggest two 110 volt filament transformers back to back.
Heaters off the intermediate connection at 6.3 or 12.6. Voltage double
from the output (primary), now the secondary of the second transformer.
115 x 2 = (roughly) 230 volts and filter it. The two separate
transformers might be easier to fit in available space.
Just an idea.

MANUALS' DESCRIPTIONS:

---

1. TV-7 Tube Tester Ops, Service, and Tube Data, 5-MANUAL SET:
($29.99)

You are bidding on FIVE different operator's, service/maintenance, and tube data chart MANUALS for the entire TV-7 series of Tube Testers. This is apparently the LATEST VERSION OF THE COMPLETE SET OF TV-7 MANUALS.

Manual #1: 100 pages, (17jan62), 6730kB, TEST DATA FOR ELECTRON TUBE TEST SETS TV-7/U, TV-7A/U, TV-7B/U, AND TV-7D/U.

Manual #2: 64 pages, (14jun60), 1867kB, OPERATOR’S AND ORGANIZATIONAL MAINTENANCE MANUAL, TEST SETS, ELECTRON TUBE, TV-7/U, TV-7A/U, TV-7B/U AND TV-7D/U.

Manual #3: 38 pages, (16jul79), 675kB, ORGANIZATIONAL, DIRECT SUPPORT, AND GENERAL SUPPORT MAINTENANCE REPAIR PARTS AND SPECIAL TOOLS LISTS (INCLUDING DEPOT MAINTENANCE REPAIR PARTS AND SPECIAL TOOLS) FOR TEST SETS, ELECTRON TUBE TV-7A/U (NSN 6625-00-376-4939), TV-7B/U (NSN 6625-00-376-4939), AND TV-7D/U (NSN 6625-00-820-0064).

Manual #4: 78 pages, (13jun60), 1761kB, FIELD AND DEPOT MAINTENANCE MANUAL, TEST SETS, ELECTRON TUBE, TV-7/U, TV-7A/U, TV-7B/U, AND TV-7D/U.

Manual #5: 4 pages, (26jul62), 85kB, Requisition and Installation of Tube Socket Savers for Electron Tube Test Sets.

These manuals are all in electronic form, in Adobe Acrobat format PDF files. The files can be read, searched, enlarged, printed, etc, using the Adobe Acrobat Reader 5.0 software, which is also INCLUDED on the CD. I also include a text file with the manual files' descriptions and any usage notes, etc. This is a wonderful format in which to have the manuals, since the Adobe Acrobat reader allows you to do things like MAGNIFY the material to be as large as you want, and includes things such as hyperlinks, which allow you to jump directly to any part of the document, and much, much more.

---

2. Tektronix 475 Operator's and Service Manual: ($39.99)

Operator's and Service Manual for the Tektronix 475 Oscilloscope. The manual consists of 222 pages, and is in electronic form, on a CD. The manual is in Adobe Acrobat (PDF file) format. The Adobe Acrobat Reader 5.0 is included on the CD, and can be used to read, search, enlarge, print, etc, the Tek 475 ops and service manual. The PDF file's size is 14,286 kB. A CD case is included.
This manual includes sections covering: General Information, Specifications, Operating Information, Circuit Description, Calibration, Maintenance, Electrical Parts List, Diagrams and Circuit Board Illustrations, Mechanical Parts List and Illustrations, and more.
Questions? Email me at tomg@fullnet.com.

---

3. HP 8660B Signal Generator Ops and Service Manual ($49.99)

Operator's and Service Manual for the Hewlett Packard 8660B Signal Generator. The manual consists of 431 pages, and is in electronic form, on a CD. The manual is in Adobe Acrobat (PDF file) format. The Adobe Acrobat Reader 5.0 is included on the CD, and can be used to read, search, enlarge, print, etc, the 8660B manual. The PDF file's size is 67,512 kB.

---

4. Tektronix 7A22 Plug-In Ops and Service Manual ($29.99)

Operator's and Service Manual for the Tektronix 7A22 Vertical Amplifier Plug-in. The manual consists of 122 pages, and is in electronic form, on a CD. The manual is in Adobe Acrobat (PDF file) format. The Adobe Acrobat Reader 5.0 is included on the CD, and can be used to read, search, enlarge, print, etc, the 7A22 ops and service manual. The PDF file's size is 8,594 kB.

---

5. Tektronix FG501A Plug-In Ops and Service Manual ($29.99)

Operator's and Service Manual for the Tektronix FG501A 2 MHz Function Generator TM500-series plug-in. The manual consists of 88 pages, and is in electronic form, on a CD. The manual is in Adobe Acrobat (PDF file) format. The Adobe Acrobat Reader 5.0 is included on the CD, and can be used to read, search, enlarge, print, etc, the FG501A ops and service manual. The PDF file's size is 1,524 kB.
This manual includes sections covering: General Information, Specifications, Operating Instructions, Theory of Operation, Calibration, Maintenance, Options, Replaceable Electrical Parts, Diagrams and Circuit Board Illustrations, Replaceable Mechanical Parts, Manual Change Information, and more.

---

6. Tektronix 7B92A Plug-In Ops Manual and Service Manual, Set of Two ($34.99)

Two separate manuals: Operator's and Service Manuals for the Tektronix 7B92A vertical amplifier plug-in. The service manual consists of 167 pages, in 3,552 kB. The operator's manual is 35 pages, in 834 kB. They are both in electronic form, on a CD. The manual is in Adobe Acrobat (PDF file) format. The Adobe Acrobat Reader 5.0 is included on the CD, and can be used to read, search, enlarge, print, etc, the 7B92A ops and service manuals.

3443. HCRA Auction - 11/2 - Feeding Hills, MA

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-31 02:29:51 UTC
From: Jim <jmullen@rockys.com>
Message-ID: <3bdf5e25_1@corp.newsgroups.com>
Source record: 48437

One of New England's Largest Auctions coming soon.

Don't miss this year's auction, it promises to be one of the best.
We've got a lot of donations coming this year that will really make it
exciting - lab test equipment, Viking II for parts, CB's, Tec scopes,
repair lab equipment and a Henry 2K are rumored to be there.

Entry is free for everyone, you need not be a club member. The HCRA asks for
10% up
to $100 dollars selling price, everything after that is yours.
Mark all items clearly with your name, call and minimum bid if you're
selling, just bring
money if you're buying!

We typically get over 100 buyers and sellers, so come early for a good seat.

This year's raffle prize is a Kenwood TH-F6A and can be your's for a $1
ticket!

Great parking, super raffle prize and coffee & donuts.

The auctions sets up at 6:30 PM and starts promptly at 7:30.

HCRA Annual Auction
November 2nd, 2001
Feeding Hills Congregational Church
21 North Westfield Street
Feeding Hills, MA 01030

More information and a map for directions can be found on our web page at:
http://www.hcra.org/auction.htm

Thanks & '73...
Jim, KK1W

Yeah, but doesn't that reverse the upper and lower sidebands?

Sure, but it's a R-390, so it doesn't matter.

And anyway, if the signals come from the southern hemisphere, they're
inverted twice, so back to normal!

All the AM stations on my radio have the same annoying interfering tone whether or not in USB or LSB. You think my inverted vee might be causing that?
_Bill

3448. WTB: National 5pf/5pf air-variable cap

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-31 03:58:51 UTC
From: John Derrico <jderrico@aplus.com>
Message-ID: <3BDF76FA.AE967120@aplus.com>
Source record: 48442
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

I need an air-variable cap for a National NC-173.
I think that it is common to many national radios that have
a Crystal Filter Phasing Control. It is possibly a 5pf/5pf
cap that is mounted on a rectangular ceramic base with 4-screws.
As far as I can tell (with the schematics that I have) it is in
the following radios:

National
NC2-40(A,B,C,CS,D), NC-200, NC-173, NC-183(+D),
NHU(-B,20,20B), HRO-7, NBS-3, and possibly many more radios.

Please look through your parts bins and let me know if you
have one available.

Thanks for your time,

John D.

So you're going to gold plate the front panel, chassis and all
the subchassis, and the mounting hardware, and label everything
in black, right? That ought to help it run cooler, since gold is
a really good thermal conductor. It probably will be really good-
looking, too, but a bit heavier than the average bear^WR-390.

Now I have an outdoor long-wire antenna, but with an unshielded
wire to one pin of the balanced input. Next step: a coax feed from
the long-wire. Then maybe a G5RV or some such lightning-attractor.

--
If you can modify it via software, then it doesn't count as hardware.

I don't do many "forward this to your friends" things,
but this is so "on target,"....

To the Staffs of CNN,NBC,ABC,CBS and NPR

With kind affection I write to thank you for your good work.

Thank you for showing the accidentally hurt Afghan child
and never once showing the mangled, burned remains
of thousands and thousands of men, women and children
at the the World Trade Center.

Thank you for spreading fear so that Americans
cower in their homes and won't even open mail.

Thank you for reporters interviewing reporters about
the opinions of reporters, so that our common views
get the most coverage possible.

Thank you for interviewing obscure "experts" who
undermine confidence in America and Britain's leaders
and military. Thank you for convincing the U.S. and
the English that the fight is lost before it is fairly begun.

Thank you for indoctrinating three generations of American
and English young people in Pacifism.
It has made our good work so much easier.

And thank you for being political activist masquerading
as journalist. Your work to undermine and bring down
the leadership of the free world has given us more
aid and comfort then an army of martyrs.

May Allah help you in your good works.
When we have prevailed, we will remember your
talents for destroying leadership and patriotism.

You shall surely be rewarded.

Allah is Great,
Osama Bin Laden

Mike -

I just saw a nice set of Pomona extenders go for sale on eBay
(7 & 9 pin as well as the Octal). Missed close, but I'll keep looking !!

No, Black panel, gold fill lettering, gold plated handles and meter covers,
display bezel powder coated knobs .
R-390's work great with a 8 foot coax/PVC (Shielded loop) feed with a 4:1
balun
http://www.hard-core-dx.com/nordicdx/antenna/feed/4_1balun.html and cheap
R-6 TV coax.
Using the rotor and sharp nulls I can get broadcast from Iowa from Long
Island at night.
"The Trucking Bozo" in West Virginia on 1170 at midnight EST
I go out in the yard to move the a piston capacitor to tweak the operating
frequency.
I installed Langford SSB and listen to these funny drunks on 3960 at times.
I had a wire it was far to noisy
A T2FD http://www.cebik.com/t2fd.html is perhaps good low noise antenna also

news:<b8MC7.7028$2K5.655353@newsread2.prod.itd.earthlink.net>...
> this is why amateur radio will die. period.

Nonsense. Amateur radio is dying because it's starting to be old hat
to many people. It's old technology. Computers and the internet are
taking over. To many young people radio is boring because they have
seen it since the day they were born and it's no big deal. It's like
color TV's. Color TV was a big deal when it came out. Now there is one
in every room and doesn't gather a second look or thought from younger
types. The moaning and groaning about CBer's or slow codes or no codes
doesn't mean doodly. Who cares or listens? I sure don't. I can blow
many 20 wpm extras out of the water on CW being I can do about 50
wpm+. Wowee gee! Golly! Dang!. Shazzam!!! Do I feel special? Not
really. Most semi old farts like me can go that fast. It's no
biggie...It's good that many of the new computer driven modes are
popping up like PSK31,SSTV etc. That merges puters with radios, and
keeps radios in the ballgame. Radio is not going anywhere. It's going
to change a lot though. It's already to the point here where my
computer is a permanent fixture to my radios. My 706 is run as a
computer rig when it's here in the house. It'll do most anything there
is to do these days. Any band, any mode. Many non ham modes included,
such as ACARS, etc.
It will be quite a while before my radio is dead. Period. I'm sure
I'll die first.

>
> i swear, instead of putting people down, why not try and share
> something, like amateur radio with them?

I only put down smartasses. They have to earn my wrath first.
>
> the little quotes below show the attitude of the majority of hams i have
> met. "look at us. were better than you cause we passed a code test." that is
> a crock of shit. in my brief life i have met more educated fools who have
> paper showing what they know, but they are dumb as a box of rocks.

So? You are talking about the code test. If I pass a faster test than
you , I am better. At that one skill...But I could care less what the
others do unless I have to work them on CW. I'm more concerned with
accuracy than speed. I'll dial my 50 wpm down to 13 wpm in a heartbeat
if the slower guy sends a decent well spaced code for me to listen to.
Heck, I'll even go slower than that if needed.
>
> the reason most people don't join the ranks of amateur radio is NOT

> because they are not interested in radio or want to operate illegally. it's
> because most amateur radio operators treat all other radio operators like
> shit.

BS. If they are that whiny and self conscious about nothing , to heck
with them anyway. I don't need to talk to them. I don't like or
associate with whiners. And I have never treated anyone like shit that
didn't have it coming. Like I said, they have to earn that abuse.
>
> i do not agree with illegal operation. i took and passed a 13 wpm code

> kindness and being humble will kill no one. let's build amateur radio, not
> destroy it. because with attitudes like shown below, we will loose. one band
> at the time.

If we lose anything, it won't have anything to do with CB. They have
already got the 11m ham band in the late 50's. There is nothing more
they can get of ours. "Unless they bootleg on the lower end of 10m".
In that case, I can fire up my 50 wpm and give the bootleggers a well
deserved touch up. And many are nearly brain dead. I've had many that
thought my CW was a defect in their receivers. "Duhhhhh....Hey good
buddy...Whats dat funny noise???? Sounds like a peckerwood on
steroids...I better take this radio to the truck stop for a checkup.."
It doesn't seem to occur to them that the cure is to get back down in
their part of the spectrum. CB'ers on 10m are a disease, and my henry
console driven 50 wpm CW chit chat is the cure. I promise they won't
do much communicating if I'm around. I'll ruin their day every time.
Part of the problem is not many CW ops on the lower part of 10m since
the code dropdown. The CB'ers seem to think we have abandoned that
section. I try to let them know in no uncertain terms, we are still
there. And don't tell me it's malicious interference because that rule
doesn't apply to people on the band illegally. They are interfering
with me by stealing my spectrum to use. I feel it's my duty to run
them off. Thats called "self policing" :) MK

3480. Tubes vs. Solid State for SW Receivers

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-10-31 23:26:06 UTC
From: noring@olagrande.net
Message-ID: <9rq1ae$la4$1@og1.olagrande.net>
Source record: 48373
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

I admit that the question I will pose is open-ended and may
not have a clear-cut answer. And answers may likely include
the phrase "Depends on...".

Nevertheless, let me pose it:

"In terms of shortwave reception performance, which type of
electronics are inherently, and in actual real-world
receivers, better: tubes or solid-state?"

When I refer to "shortwave reception", I mean all forms of
reception (AM, sideband) from the 500khz to 30mhz, and for
all forms/types of broadcasts (ham, international broadcast,
etc.)

When I refer to "performance", I mean the ability to pull in
very weak signals and to reduce interference from adjacent
stronger signals. E.g., sensitivity and selectivity. Also,
delivered sound quality is important for understandability,
and comes under this question if it can't be separated from
the receiving circuitry. There may be other benchmarks as
well which are important but I haven't mentioned.

Of course, there's the possibility of hybrid circuits, using
a combination of vacuum tubes and solid state devices (such
as transistors).

I'd like to know what makes/models of radio(s) throughout
radio history up to the present are representative of this
'best', or close to it. Also, I and others would like to
know which "budget" radios of today come closest to the
'best' performance.

I look forward to the discussion and to learn a lot from it.

Thanks.

Jon Noring

Not again! Well, IMO, tubes allow for a greater audio range. But compared to modern day solid state equipment, they fall short. In the old days, you basically had to guess where to tune on the dial for a station. Thanks to PLL and digital tuning, you don't have to anymore. Although you conceivably COULD add a digital freq readout to your old tube set. Miniaturization adds a lot of stuff that the old tube sets couldn't have. If 1 tube =1 transistor, then just the amount of transistors in a modern set gives it an edge, not counting the microchips in there too. The bad part is that concievably a modern rx could have more trouble with power spikes and such, but that is outweighed by the pluses.

In my question I specifically focused on shortwave reception
performance, not on the obvious plus of PLL and digital
tuning, which makes for a lot more convenience and knowing the
exact frequency.

Can modern state-of-the-art solid state designs have
comparable if not better sensitivity and selectivity than
state-of-the-art tube designs? (There may be other measures
of reception performance, but sensitivity/selectivity are
the two I know of.)

There should be no inherent difference between tubes and solid-state. A signal doesn't care whether it's amplified in a tube or a transistor, etc. People like me collect tube boatanchors because they are historically interesting and, well, cool, not because they have some intrinsic advantage over solid-state gear. There is much discussion of tubes vs solid-state in audiophile circles; I think most of it is hooey (please no flames, this is just my $0.02 :-).

You may get a lot of opinions on what receiver is "best," since there's no agreed definition. For example, if you discount audio, then I'd consider my Hallicrafters SX-42 and Hammarlund HQ-180AC roughly equal. But the Hallicrafters has a superior (i.e., push-pull) audio section, so I guess it's "better" if audio quality counts. On the other hand, the HQ-180AC was made about 20 years later than the SX-42, so how should that be factored in? And should appearance count? The SX-42 has a distinctive, widely praised design, while the HQ-180 looks more like a piece of lab equipment. And so on . . .

That being said, the best boatanchor that I own is a Hallicrafters SX-88. (See http://antiqueradio.org/comm.htm .) Many people think the military R-390/A is one of the finest tube receivers ever made. There are many other good ones out there.

Regarding today's radios, wouldn't you expect a lot of them to perform better than equipment designed fifty or sixty years ago? Science marches on, and I think electronics has been no exception. When I got a cheap (around $100 used) Grundig YB400 a few years ago, I discovered that it seemed to pull in anything I could get on my favorite boatanchors, using only its built-in whip antenna. This bummed me out a little at first, but then I decided I was happy there had been some progress in electronics during my lifetime :-)

You can read many reviews and comparisons of current shortwave equipment at the Radio Netherlands website:

http://www.rnw.nl/realradio/rx_index.html

This answer makes sense in the context of the question being HF
reception. However it is not true as one goes up in frequency. At UHF
frequencies, a modern solid state RF amplifier first stage (GaAs FET for
example) is inexpensive and has a better noise figure than any available
tube amplifier.

Not much contest, but the 1A was quite a good receiver in its day. Its
value nowadays is more its rarity.
Something like a R4-C, apart from the difference in coverage is likely a
better performer than the R8B in many respects.

If ham radio dies, it will be because of all the disgruntled people
who hate ham radio but got roped into a class and now have a
license to bitch about ham radio because it isn't what they
wanted after all. Once they go away we can go back to
business as usual (I wish). Why do they need ham licenses
anyway? I thought they had their own band.

Jim, ac6tk

: > this is why amateur radio will die. period.
:
: Nonsense. Amateur radio is dying because it's starting to be old hat
: to many people. It's old technology. Computers and the internet are
: taking over. To many young people radio is boring because they have
: seen it since the day they were born and it's no big deal. It's like
: color TV's. Color TV was a big deal when it came out. Now there is one
: in every room and doesn't gather a second look or thought from younger
: types. The moaning and groaning about CBer's or slow codes or no codes
: doesn't mean doodly. Who cares or listens? I sure don't. I can blow
: many 20 wpm extras out of the water on CW being I can do about 50
: wpm+. Wowee gee! Golly! Dang!. Shazzam!!! Do I feel special? Not
: really. Most semi old farts like me can go that fast. It's no
: biggie...It's good that many of the new computer driven modes are
: popping up like PSK31,SSTV etc. That merges puters with radios, and
: keeps radios in the ballgame. Radio is not going anywhere. It's going
: to change a lot though. It's already to the point here where my
: computer is a permanent fixture to my radios. My 706 is run as a
: computer rig when it's here in the house. It'll do most anything there
: is to do these days. Any band, any mode. Many non ham modes included,
: such as ACARS, etc.
: It will be quite a while before my radio is dead. Period. I'm sure
: I'll die first.
:
: >
: > i swear, instead of putting people down, why not try and share
: > something, like amateur radio with them?
:
: I only put down smartasses. They have to earn my wrath first.
: >
: > the little quotes below show the attitude of the majority of hams i have
: > met. "look at us. were better than you cause we passed a code test." that is
: > a crock of shit. in my brief life i have met more educated fools who have
: > paper showing what they know, but they are dumb as a box of rocks.
:
: So? You are talking about the code test. If I pass a faster test than

: you , I am better. At that one skill...But I could care less what the
: others do unless I have to work them on CW. I'm more concerned with
: accuracy than speed. I'll dial my 50 wpm down to 13 wpm in a heartbeat
: if the slower guy sends a decent well spaced code for me to listen to.
: Heck, I'll even go slower than that if needed.
: >
: > the reason most people don't join the ranks of amateur radio is NOT
: > because they are not interested in radio or want to operate illegally. it's
: > because most amateur radio operators treat all other radio operators like
: > shit.
:
: BS. If they are that whiny and self conscious about nothing , to heck
: with them anyway. I don't need to talk to them. I don't like or
: associate with whiners. And I have never treated anyone like shit that
: didn't have it coming. Like I said, they have to earn that abuse.
: >
: > i do not agree with illegal operation. i took and passed a 13 wpm code
: > test for my present license. all i'm saying is, give kindness to get
: > kindness and being humble will kill no one. let's build amateur radio, not
: > destroy it. because with attitudes like shown below, we will loose. one band
: > at the time.
:
: If we lose anything, it won't have anything to do with CB. They have
: already got the 11m ham band in the late 50's. There is nothing more
: they can get of ours. "Unless they bootleg on the lower end of 10m".
: In that case, I can fire up my 50 wpm and give the bootleggers a well
: deserved touch up. And many are nearly brain dead. I've had many that
: thought my CW was a defect in their receivers. "Duhhhhh....Hey good
: buddy...Whats dat funny noise???? Sounds like a peckerwood on
: steroids...I better take this radio to the truck stop for a checkup.."
: It doesn't seem to occur to them that the cure is to get back down in
: their part of the spectrum. CB'ers on 10m are a disease, and my henry
: console driven 50 wpm CW chit chat is the cure. I promise they won't
: do much communicating if I'm around. I'll ruin their day every time.
: Part of the problem is not many CW ops on the lower part of 10m since
: the code dropdown. The CB'ers seem to think we have abandoned that
: section. I try to let them know in no uncertain terms, we are still
: there. And don't tell me it's malicious interference because that rule
: doesn't apply to people on the band illegally. They are interfering
: with me by stealing my spectrum to use. I feel it's my duty to run
: them off. Thats called "self policing" :) MK

Hi,

Well like anything the answer depends a lot on what you call similar radios. If you compare an R-390 to a modern radio costing the same dollars new you will get one comparison. If you adjust 1952 dollars to 2001 dollars you will get another comparison. If cost is no object the comparison will be different as well.

Assuming you have a lot of money to spend then solid state wins every time. Most of us don't have radio budgets that start at $250K and go up from there. Not many of us ever see such radios let alone get a chance to use them.

Enjoy!

Oh. Ok, here's what I know: I had a Hallicrafters that had a knob for "selectivity". I guess this was a crude attenuator. All I know is that it never seemed to make much of a difference in the actual sensitivity/selectivity of the reciever except to slightly tone down stations that used big kilowattage like the Euros. You have to consider too that tube stuff will have paper caps that have gone bad and resistors out of value and such that will reduce the effectiveness of the reciever. Solid state stuff is much less likely to have such problems, probably because the quality of the components were better to start with. Also a lot depends on your antenna, and THAT is more an art than a science. Now if you want a debate on "which were better new, tubes or transistors?" then you'll have to talk to some of the old tube guys on here.

tube design has not advanced like solid state..
i'll bet none of the ham dx or ontest winners use a tube rx..
just like fuel injection replaced carburetors, solid state has replaced
hollow state..
if i'm wrong i sure would like to know..
but for your own satisfaction you can take the best tube rx you can find
such as a Drake R4C or Collins 75S3C or any other tube rx and put it up
against a Rx in a ham xcvr such as an IC 765 or Kenwood 940 and you'll have
the answer..
tubes like buggy whips and carburetors served their purpose and except for
very unique cases are of historical interest..
just as the best mechanical watch that costs thousands can't compare to a $5
quartz in keeping time..
but it has snob appeal, the rolex not the timex...
good luck
hank
good luck..

3500. Boatanchors and Parts For Sale

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-01 02:19:33 UTC
From: Joel Levine and Barbara Pickell <wb2bmh@optonline.net>
Message-ID: <Vi2E7.65457$C7.17430210@news02.optonline.net>
Source record: 48294

I am posting this for a friend who does not have a computer. Please do not email me because I do not have any additional information.

Chris is selling off a collection of boatanchors and parts and wants to sell the entire collections as one lot. His collection includes a number of Hallicrafters, Heathkits and Nationals as well as parts. If you are interested, call Chris 631-549-5128.

3501. For Sale: SP600

The usable sensitivity 'floor' was reached probably back in the 1940s.
As for selectivity, yes, the 'digital bandwidth' designs defintely offer specs in selectivity that were not possible in the tube era. The question remains as to how much of the improvement is actually usable. Much of the solid-state gadgetry finds new limitations in regard to synthesizer garbage and strong signal handling capability.
It makes it real different to compare...there were high-end tube receivers and there were junk tube receivers.
If you were to take a R-390 and put it side-by-side with say a RX-340 (or plug in your favorite modern high-end rig) I think you would find the R-390 able to pull-in and slice out weak crowded signals just as well...and each would probably have situations where circumstances gave an edge to one above the other.
On the cheap end of the scale, a simple little DX-375 will run rings around any equivalent low-end tube receiver.
The worst of the whole lot were some of the early solid-state designs of the early 70s.
-Bill

All of the top of the line units are good, whether they are solid state of tube units. I've had several of the tube jobs, and my all time favorite is the Collins 51J series of receivers. I had a 51S-1 for awhile, and it wasn't a bad receiver. Its shortcomings were lack of preselection below 2MHz, and a problematic bandswitch. Of course, mine came from the labs at Rockwell, so this unit had quite a bit of wear, but 51J series of receivers were also used in those labs, and they held up much better. As far as sensitivity, as long as you have an 8 to 10dB noise figure, you are doing ok.

I am looking for an interstage audio transformer (pp plates to pp grids,
with separate (not center-tapped) grid windings. The Stancor A-4777 or
Thordarson T58A70 are, I believe, representative of what I need.

Anyone have something along these lines?

Joe

If you talk to some of the folks at Rockwell-Collins, the favorite all time receivers are the HF8050 series, and the 851S-1, which is an HF8050 with an optical encoder for tuning, instead of those thumbwheel switches. I picked up several of those 8050s at Rockwell's surplus sale for 5 dollars each, although they were incomplete. Before I moved back to Chicago, I let one of the old timers back in Iowa have them, and he was able to piece one or two complete units together. I had an HF2050 for awhile, and I do have a Racal 6790/GM in my collection. While they are nice to have, they are BIG. When I can build a receiver for aroung 150 dollars that has the same type of performance as these giants, I figured, "why bother". Probably my favorite receivers of today are the AOR7030, the Icom R75, the Palstar R30, and the Yaesu FRG100. They do fine, for household listening. Now, if you were going to use them in a shipboard installation, with several co-located transmitters.....well, that is quite a different story. I used to once look at the ads, where one manufacturer would say "mine is better than the others", or "Yaesu did it again!" I made sensitivity measurements on these different receivers, and the MDS would range from .07uV to .1uV or so. These are good figures! As far as selectivity, the Palstar R30, with its CFJ series of 11 element filters, the Icom R75, and the AOR7030 are pretty much in the same league. As far as overload rejection, these units are similar. One receiver I didn't care for was the AOR3030. I can't believe that company had the nerve to charge over 800 dollars for that unit. As it comes out of the box, it has the worst 2nd order IM rejection that I have ever seen. In order to make the 3030 acceptable, you need to change the switching diodes in the front end, the AGC diodes, and the I.F. filter switching diodes. After you do these mods,the 3030 is pretty good. Also, the sensitivity is pretty flat over the tuning range.
One final note; if any of you have purchased the Icom R75, feel free to e-mail me directly, and I will be glad to inform you on how to properly remove that MW attenuator. Simply jumpering that CP pair of pads does not remove it; you still have the shunt elements remaining. Thanks for taking the time to read this post folks; this is a great group, and there are some pretty sharp folks on it!

I modeled a switching supply which should be easy to build. Take a look at the application notes for the LM3524 pulse width modulator on the Nat Semi webiste (the "step up" configuration). You would 1/2 wave rectify the HV output of the existing transformer, and feed this as the DC input to the choke. A HexFET could be used to pump the inductor. I used a 10kHz frequency and 30% duty cycle and the output was a neat 200VDC. The inductor is 1mH and filter capacitor 200uF. You could fit all the above into about 1/2 the space of a 5U4G. The LM3524 will operate from a single supply which you should be able to pull off pretty easily. The low switching frequency means that you won't generate a lot of QRM.

Looks like you have created some interesting comments so far. My 2 cents worth is that I have been using
both tube and solid state rigs for many years. I like both. The newer rigs have many ways of elimating noise
and seperation of stations that are very close together. For just regular short wave listening they both are
equal in many ways and both very enjoyable to use. The major differences that I see is that the newer solid
state rigs just will not keep my ham shack as nice and warm doing the winter months as the tube units will. In
the other case, the solid state rigs help to keep my ham shack cool doing the summer months. So I guess the
real answer is to have both and instead of calling them the tube unit or sold state unit, we as hams should relabel
them to being our summer or winter rigs. I for some reason, still enjoy listening to the shortwave broadcast over
my tube units more than I do my newer rigs. The old tube units just don't have birdie effects when tuning the bands so
if you here something on a tube unit it is usually a station or some nose coming thru the antenna, but not noise generated by
the rig itself. On the tube units, if a tube goes out, easy replace, if one can be found, on the solid state unit, it most likely will
have to be sent back to the factory due to specialize compentents except in a few cases. I have tube units that are at least over
40 years old and working about as good as when they were new and also have some sold state shortwave receivers that are around
30 years old and they too are still working. I would say that the solid state units will most likely out last the usefullness over the
tube units mainly due to parts not as easy to be found for the tube units. One thing for sure is that the tube unit will continue to
operate if there comes a time when there is an electromatic explosion, of course may not be anything to listen to as most of the
transmitting stations would more than likely be solid state and be effected by the explosion, but you can at least stay warm listening
to electrial noise....good luck with your question and answer. I just had to add my 2 cent worth along with some humor.

Surprisingly, its easier to repair some tube units that try to located
"orphaned" ICs
This may change with time -- guess we will wait and see !

The explosion you are referring to is actually an EMP (ElectroMagnetic
Pulse). An EMP occurs with a nuclear explosion and may be created by an
asteroid or comet impacting the earth.

Solid state components can be design for "radiation hardening" and tolerance
to EMP, but as you pointed out 1) Who will be around to broadcast? 2) Who
will be around to listen?

Time was, there were two factors that "consumer" grade receivers had a severe problem overcoming, that being, 3rd order intercept point and dynamic range. The solid state circuits (mixers and amps) simply could handle the wide range of levels. I don't believe that sensitivity, per se, was an issue. A number of years back, a group of us hams at our lab did some tests with currently available radio sets; namely, Collins 75S-3C, a couple of Icoms (735?) etc., an SX-100, a RadShak, a Racal RA-17C.. you get the idea. In virtually all cases, the vintage (read: tube) sets did far better than the solid state equipment.
I contrast this with the more current crop of equipment such as my FT-1000D, and FT-990, etc. These sets do a much better job than their solid-state predecessors. The only thing I do still see is the ultimate dynamic range. One still has to use attenuators and/or resort to turning on/off RF preamps to get the full available dynamic range and to offset the inherent problems, thereof. Problem? In reality, probably not. Its just something one has to factor in. Now... if one wants to get into the Ford/Chevy-type shortwave argument, then I'll go for my R-390A, maybe my SX-28, or if I get really nostalgic, my old (but fully restored) HQ-120X..... hi hi!! 73 and pass me another 6SK7....please!

|Can modern state-of-the-art solid state designs have
|comparable if not better sensitivity and selectivity than
|state-of-the-art tube designs? (There may be other measures
|of reception performance, but sensitivity/selectivity are
|the two I know of.)

At the frequencies involved, sensitivity is almost a non-issue. Atmospheric noise is the limiting factor. On 10 meters with a directional antenna, external noise might be low enough to tax the "sensitivity" of a not so good receiver, but there is not inherent superiority of one amplifying device over another at these levels.

In spite of the foregoing, by using solid state devices rather than tubes, it is "easier" to achieve low noise amplification. If you consider even higher frequencies, then there is absolutely no contest; stick a fork in your vacuum tube, it's done.

Likewise, selectivity is not a function of the type of amplifying device used. There may be (are) issues related to impedance levels, agc characteristics, overload performance, etc. that dictate how the selectivity is achieved and these are a function of the device type. Selectivity is achieved with tuned circuits; capacitors and inductors, or their mechanical equivalents.

If you limit your receiver "figure-of-merit" to only sensitivity and selectivity, you make a mistake. In today's crowded bands, the various performance parameters dealing with overload characteristics are very important.

Hello Fellow Anchorites
I am looking for 2 Ranger cabs & 1 bezel to buy to fill out cab sets. Any help appreciated.

I am now doing refinish on the Johnson 500 panels & cabs. If interested please contact me @ sig below. Price for the rf panel, bezel, crystal knob, & cabinel is $300.

I now have the silk screens "burned" for the R390A.
Price: Front side, $125. both sides $225.

Prices dont include shipping. Want to see some of my work? Visit my web page.

You may be more accurately comparing tranceivers against rcvr+xmtr. If you could make the relays click fast enough, an HT-32B/SX-115/HT-33 wouldn't embarrass itself in a contest.

Sensitivity and selectivity are relatively easy. Even relatively early solid state designs (good ones from the 60s and early 70s) were the equal or better of tube designs. It's easy to get lots of gain with transistors, and their noise figure is lower than that of tubes, so sensitivity is no problem at all. The old tube designs mostly used low final IF frequencies and L-C filters for selectivity; the crystal filters used in good modern designs are superior in most ways.

More difficult is strong-signal handling. The aforementioned solid state receivers were terrible at it; one strong signal could make the things fold pretty badly. It was made even worse by the lack of front end selectivity, which was taken out in the interest of size and cost reduction. (Those multi-gang tuning capacitors are large and expensive.) However, the state of the art has improved since then; a good modern solid state design is at least the equal of a tube receiver in that way as well.

And, of course, modern designs give you the conveniences of synthesized tuning, memories, and so forth. On the other hand, no modern design matches the feel of the big weighted tuning knobs of the boat anchor era. So it goes.
The popular portable receivers, however, are still likely to be lacking

in strong-signal performance when compared to a good boat-anchor. High receiver dynamic range generally means receiver circuits that use a lot of power; portable receivers are optimized for low power consumption, not the ultimate in performance.

Unfortunately, I end up with the job of getting all my company's products through FCC and CISPR. My experience with switching supplies has been that the lower switching speeds do not necessarily reduce the harmonic radiation. It is the sharp edge of the pulse that causes the problem, and this is the same even if you lower the frequency. There are ways to overcome this, but at the sacrifice of some efficiency, and increased heat dissapation in the switch. Lower switching frequencies make the approaches to slowing the transision times more practical. "Out of the book" designs will have harmonic patterns that look much the same at switching frequencies of 10kHz or 100kHz. The only difference will be where the harmonics start.

If you really want to eliminate the harmonics, put the whole thing in a metal box and go in and out with feedthrough capacitors. On the inside of the box, use a common mode choke on the input leads.

I have a DT-600 RTTY demodulator with built in power supply, loop supply with mercury relay interface, and solid state auto start relay. This unit also includes the Mainline XK-2 crystal AFSK generator. It is set up for 170 cycle shift for use with a model 28, 19, etc. Everything is built into a very high quality 3 X 9 X 12 Moduline desktop cabinet. All you need is to plug in your loop line and the AC for the RTTY unit and go. A scope output is included for tuning. All documentation is included. $100 OBO.
Note: I plan on going to the Ft. Wayne Hamfest.

3537. RBS/RBM B/S switch cleaning?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-01 17:44:12 UTC
From: doran platt <doran.platt@noaa.gov>
Message-ID: <3BE189EC.E4A12241@noaa.gov>
Source record: 48332

Anyone out there know a way to clean (read: spray some deoxit) the contacts of the bandswitch wafers in the RBM or the RBS receivers? Recall that these receivers have buttoned-up boxes for each switch section. Or, is there no choice but to disassemble the switch and unsolder leads for each box? Both my RBS and RBM require juggling the bandswitch to get good contact, sometimes. Thanks in advance.

>"In terms of shortwave reception performance, which type of
>electronics are inherently, and in actual real-world
>receivers, better: tubes or solid-state?"

Define "Better."

Romance: Tube receivers have it. I like big heavy chassis filled with warm glowing tubes. They look neat.

Dynamic Range: You can achieve better performance if you spend equivalent inflation adjusted cash on solid state receivers compared to the tube receivers of yesteryear. One feature often overlooked is that because tubes are inherently high impedance devices, they often had some pretty effective stage to stage coupling selectivity. Thus dynamic range of tube gear is good, not because the active device is good, but because the tuned circuits from stage to stage were good. Modern wide-band solid state gear can better the performance of the tube gear with less distortion and no tuning adjustments are needed.

Audio: Tube audio amplifiers have a sound all of their own. This is because when they distort, they do so in a pleasant way that is actually sought out by musicians. Modern solid state gear often lacks decent audio amplifiers because they're usually afterthoughts. Some solid state radios are trying hard to rectify this image. Grundig's YB-400 design is one such example, but they have a long way to go...

Sensitivity: Solid state gear can have a lower noise than a tube front end. Not that this matters much on SW...

Stability: Tube gear is not nearly as stable as today's high tech solid state receivers.

Frequency coverage: With solid state gear, just tune right to the frequency and there it is. With Tube gear you may need to change a band module or re-peak a front end somewhere...

As you can see, there are positive and negative aspects to this argument. I could go on like this and so can many others. Define what "Better" means and then you can make up your own mind.

73,

Jake Brodsky, AB3A mailto:frussle@erols.com

There is no inherent performance difference, except in
the minds (if that's the right word) of a certain circle
of incurable luddites who never quite figured out the 20th
century, and are terrified of the 21st.

The problem with such a comparison is that you're comparing
apples and oranges. A good tube radio is a good radio indeed.
As is a good solid state radio. The solid state radio
benefits from several decades of additional development,
whereas tube radio performance peaked in the 1950s. If any
performance difference is to be had, it is on the side of
solid state - and please spare me the garbage about "warm
tube sound" and similar nonsense. I don't care if my radios
glow in the dark. I care how well they work.

The problem comes when you start comparing specific models.
The best receiver in my home is a Collins 51J-4, which does
indeed run rings around my Realistic DX-394. However, the
Collins cost as much as a car when it was new. If you were
to compare a solid state receiver that cost as much as a
car *now*, it would blow the Collins away in every measurement.

You can get very good radios now. Rather than misguided
self-indulgent nostalgic nonsense, why not use one and listen?

I don't see any reality in this argument. Plus a lot of this circuitry has to do with non-rf sections of the receiver.

And nothing like those mechanical filters!

Can anyone think of something worthwhile to do with this 1945 freq meter in wonderful shape, besides cannibalize it? Gee, old Signal Corps guys even put a nice regulated supply into its battery compartment. Are we finally coming full-circle, to things that ought to be cannibalized or converted like the late '50's, rather than used?

...and from what I have seen most modern receivers have lousy specs.
They would rather mention the number of memory channels than
IMD/overload performance. Perhaps they don't mention what really
matters because they are lousy? I would rather have a well designed
clean tube design than a typical transistor receiver. Just because
you can receive from DC to X-Rays with a built in Pentium IV doesn't
make it a good radio! One of the best receivers ever built was the
R390, all tubes, and was used by the CIA up into the '80s (in fact,
won't suprise me if they still use them).

As far as those microchips are concerned, they generate spurs and
other squirrelys.

You can also usually break 7 & 9-pin toobs easily enough for a useable base, which is the only part that's hard to break. One can solder leads to the insides of the pins, then 'poxy the thing up.

|GUESS YOU NEVER SAW AN AR88---CRYSTAL FILTER
|OR THE BC348,BC312,BC318,BC324-----ALL USED XTAL FILTERS

Golly, Mark said, "Mostly used".

A BC-342 was my first radio, circa 1955. A friend talked me into trading the '342 for a '348. Big mistake on my part. I since have reacquired three BC-342s. I also once had an AR-88, several BC-348s and a Collins 75A-1. All of them used single crystals in a bridge arrangement to offer decent CW selectivity and the ability to null an interfering carrier on phone.

The skirt selectivity was abysmal, as was the ultimate rejection. The Collins crystal case leaked and I was constantly taking the crystal out and cleaning off the contaminants to get the Q back.

The crystal filters in those receivers were nothing like the modern lattice, half-lattice or monolithic crystal filters. Not even close.

|
|
| Now there's a place for argument. Compare the R390 with the R390/A. I
know
| the 390 has an additional RF amplification stage, while the 390/A has
| mechanical filters. There are afficianados of both.

A simple solution.

Then one should own both.

| To the initial question, there are so many variables to design, that it
is a
| difficult question to answer. What might be really interesting is to have
a
| contest: someone build a state-of-the-art solid state rig, and someone
else
| build one with tubes. Keep the basic radio design the same:
single-conversion
| superhet. Design them to cover 49m SWBC band. Don't need fancy bells and
| whistles, just good basic receiver performance. Stick them in the lab and
test
| them. Stick aerials on them and *really* test them.
|
| This could be fun. . .

Hi,

A lot depends on what kind of shape it's in. If it has the calibration manual and the box is in good shape I'd hang on to it as is. If it is missing the manual or other bits and pieces then maybe not.

You can turn them into pretty good direct conversion radios without a lot of major work.

Enjoy!

3555. TUBES NEEDED:

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-02 02:34:49 UTC
From: Gregory Allan Gifford <cleophus@HiWAAY.net>
Message-ID: <2DnE7.20899$Z2.4176045@e420r-atl2.usenetserver.com>
Source record: 48249

Hey Everybody, I am in need of a couple of tubes. I need a 6X5 GT and a 7B7, new, or as new. Ya'll dig through your tube caddys and see if you can come up with them. Please send me a price if you find them. Thanks,

--

3556. Audio Filters for sale

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-02 03:40:19 UTC
From: NZ8J <timcook@erinet.com>
Message-ID: <3be21574$0$37102$4c5ecdc7@news.erinet.com>
Source record: 48250
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.shortwave,rec.radio.swap

1. MSC "Smart Filter" scaf design, variable hi and low pass with leds showing the passband. On CW the controls vary the bandwidth and center frequency. Excellent filter. looks and works good. with wall cube power supply - $78

2. JPS NRF-7 DSP filter, autonotch, peaking, W and N CW and SSB, Data position, 10 different fixed filters in all. Looks and works great. -$78

3. JPS NF-60 DSP autonotch only works fine at normal listening levels, but when volume is turned up loud it will overdrive the filter at times and distort. Under normal conditions, it works fine. will sell for $28

priority mail shipping included in the CONUS
please email for more info if necessary
Thanks
Tim
NZ8J

3557. FS: Heath HP-23 power supply

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-02 03:56:24 UTC
From: Your friend Bill <"See the reply to address and take out NO"@coqui.net>

For sale. Nothing spectacular about it. Works fine, no apparent hum on
the rig I have tried it with. Average condition...not beat up, not
mint. Will include the PS plug end of the cable. $60 and count on
$15-20 for Priority Mail shipping. Would love to trade for a Galaxy 5
PS. Inquire herein.

Got this in a deal with an SP-600. Can anyone tell me what something like this is worth?

It has a nice 1.5"-2.0" scope built in and is about 6"-8" tall and regular rack width.. The chassis slides out of the case and rotates 90 degrees to work on.

It was made for the Navy by Hoffman Radio of Los angeles.

Thanks a bunch, guys!

My beef is mostly cheap mechanical IF filters, they ping.
Making these modern day radio sound gronky.
In the case of the R-390 it had L/C IF filter's, it's a totally different
sounding radio then the A model
Perhaps both SS and tube may be a good idea:
I believe it should have tube IF with L/C filters and class A push pull
audio with notch and EQ

Source record: 48259

There's not a lot one can "do" with an old BC-221, these days. Having said that, I hope you don't see fit to cannibalize it. There aren't that many good parts inside that one could readily use, save the capacitor... and what would one do with it? Build a VFO? I, personally, have two BC-221's, one a metal case, the other wood. They look nice with the other boatanchors and they both work. I also have an LM (Navy meter, same usage as the '221) in the collection. These instruments represent the latest in technology for the period. Why not just put it on the shelf and have it admired by all? They only go for $20-$50 on Ebay.. less at hamfests. One won't get rich on one of them.. for sure!! And just remember.. maybe some Tech Sergeant used it to setup BC-375's and a BC-348's in a B-17 squadron somewhere in England in 1944... or maybe just at Luke Field in 1949.... But what the heck, you've got history in your hands.

Source record: 48258

The CV-89 used to be a good find for those who were on RTTY. As I recall, the '89 is an audio input converter (vs. the CV-57 which was, if I recall correctly, an IF input converter). With modern TU's er.... data engines, those types of equipment are complete dinosaurs.. all they'll do it wide-shift RTTY. But, there's always the collector factor. That's where it may have value. I'd suspect that some collector would buy it. Try E-bay.

I fully agree, Laura.

This has been an interesting thread, but I have noticed that most
people miss the main point. They are comparing technologies, not
proper receiver designs! You can build a good receiver with either.

My main point, which nobody has responded to yet, is that companies
seem to put more emphasis into dual VFOs, memory channels, computer
interfaces, etc. when they should be putting it into good solid RF
design.

LEDs have a really crappie PIV - at a minimum, put a diode
in series if the source is AC. I re-wire: If AC, I put in a rectifier
and cap. I use an LM317 regulator to set the voltage. I'd rather
put the extra effort in once, than to have to go back in and replace
the LEDs.

Pete Gianakopoulos wrote:

Heathkit used the names of Native American tribes for a lot of its
ham and shortwave gear in the 1950s and 1960s.

The RX-1 Mohawk was a huge fixed-station ham bands only receiver.
The GC-1A Mohican was a smallish portable general coverage receiver.

I own a Mohawk.

3575. Re: ILLEGLE CBERS

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-02 16:48:53 UTC
From: ehsjr@bellatlantic.net
Message-ID: <3BE2CE45.4075BDE9@bellatlantic.net>
Source record: 48269

Bullshit. I have never met a ham who was not willing to
help a newbie, if the newbie was interested. That of course
does not mean that there are not some hams who would
refuse to help. But if the person has the interest, hams
can help, do help, will help and have helped.

Many CBers and non CBers hold licenses today as a result of
"formal" ham classes. Many licensees who did not have the
assistance of a "formal" ham class have received assistance on
an individual basis. Those are facts.

The common denominator in the majority of hams you have
met is ... you. Perhaps whatever mindset you bring with you
is the problem, rather than "their" attitudes.

The crybabies who focus on the negatives - "it's stupid", "it's
too hard", "they think they are better than us" etc. - waste
their energy. During the time their focus is on the negatives,
they make no progress. The time they spend bemoaning their
situation would be better spent on improving it.

Your paragraph (following) shows no grasp of the facts:
"the reason most people don't join the ranks of amateur radio is NOT
because they are not interested in radio or want to operate illegally. it's
because most amateur radio operators treat all other radio operators like
shit."
Fewer than .24% - that is point 24 %, not 24 percent - of the people
in the US have ham licenses. Put another way, and in rough numbers,
that's about 1 person out of every 500 that has a ticket here. The reason
most people don't join the ranks of amateur radio is they are not interested.
If there were more interested people, there would be more ticket holders.
How many people are beating down your door to help them satisfy their
interest in getting a ticket? (I'm assuming you do not have the negative
attitude you accuse others of)

You said "all i'm saying is, give kindness to get
kindness and being humble will kill no one."
I'm not so sure that your labeling of most amateurs
as having some kind of bad attitude fits within the
concepts of kindness and being humble.

Here is the Marshall, WI company (Hammarlund clocks, lenses, front panels
and paints) :

Hammarlund HQ129X BRAND NEW, FRONT PANELS, are available.
These are beautiful brand new reproductions of the very first, HQ-129X
receivers.
(there were four different front panel versions). This is the original.
Gives that HQ129X
a brand new look!!
Order HQ129XFP $55.00 Plus $3.00 Ship

R&R Designs On Line Catalog.

There is a site which sells newly manufactured front panels. They look rather good!

Does anyone have a manual or pod for one of these logic analyzers?
I have 3 analyzers but no manuals or pods or wires. I will reward you
handsomely for a manual copy and/or pods/wires.

Thanks,

MR

3580. Wanted.. Johnson Power plug

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-02 17:43:59 UTC
From: jackgxyz@one.net
Message-ID: <tu5mmlhmmu8969@corp.supernews.com>
Source record: 48273

Hi,

I am restoring a Johnson Valiant and I need the power plug that has a built-in holder for two 3AG type fuses. I believe the manufacturer name on the plug is Elmenco.

Anyone got one of these in a junk box, or know where I can buy one?

Thanks,

Jack, WB8BFS

PS. Please remove the xyz from the email address if you care to respond.

Boat Anchor Pics
http://oak.cats.ohiou.edu/~postr/bapix/

Specific pictures of the HQ-129X
http://oak.cats.ohiou.edu/~postr/bapix/HQ129.html

The HQ-129X had at least four different front panels (documented)

1.) The front panel markings are in white.
2.) An earlier panel style had the Hammarlund name and the HQ-129X model number in red-orange with all other front panel marking in white.
3.) The front panel had an older two-color style.
4.) A another variation had the Hammarlund name and model number in black.

I have a complete AM station I would like to move. The gear was on 10 until recently but I have run out of room.

HQ-170A-VHF receiver, Elmac AF-67 Transmitter (160 to 10), rare PS2V power supply and very rare cable from the power supply
to the AF-67. The AF-67 has been called a smaller version of the Viking Ranger.
All you need is a relay, antenna, and mic or key and you are
on the air. Guaranteed to not be DOA have Elmac original manuals and W7FG 170A manual. I don't want to ship but can deliver to Lawrenceville hamfest this weekend. $350 for the lot.

Galaxy GT-550 with AC power supply and power supply console. With manual and extensive notes. This one was in the shop 3 years ago
so again guaranteed to not be DOA. Deliver to Lawrenceville hamfest. I also have the F3 CW filter and its negotiable with the deal. $200 for all.

I might ship or bring to another hamfest.

There is merit to the discussion that some real craphounds find their way into amateur radio. However, I have found this to be less of a problem when one seeks the rest of amateur radio, I.E.: the less used modes, frequencies, and sub-interests.

As in real life, it seems that wherever the "main attraction" is, you will find strife and misery. Local ham clubs can be a disastrous experience for newbies. I have often found them to be highly visible collection points for spies, fatheads, shysters, junk collectors waiting for widows, power mongers, celebrities who don't have any other life, pathetic wanna bees and worshippers, and few who wish to attempt to rescue the newbie from the power struggles, politics and opportunists. Then there the "bullet stoppers" clubs where volunteers do police work, despite the fact that they do not truly have police badges, but they know someone who does, and hope to be able to beat down their potential competition or adversaries with fascism. What these people don't realize, is that they aren't really insiders. Just well known. So should never refuse an offer to help without a real good excuse, nor should they bother with jobs or families as they are a distraction and potential security risks.

Having said that, I have met a great deal of hams right off the air who are great people so long as one does not try to get deeply involved with the soap operas that so many families have. Also, it seems that if only 50% of club members ever show up at meetings, bear in mind that maybe only 1% in an area are even members.

I'm not saying completely avoid ham clubs, though. Just don't wear your heart on your sleeve.

Jim, ac6tk

: Bullshit. I have never met a ham who was not willing to
: help a newbie, if the newbie was interested. That of course
: does not mean that there are not some hams who would
: refuse to help. But if the person has the interest, hams
: can help, do help, will help and have helped.
:
: Many CBers and non CBers hold licenses today as a result of
: "formal" ham classes. Many licensees who did not have the
: assistance of a "formal" ham class have received assistance on
: an individual basis. Those are facts.

: The common denominator in the majority of hams you have
: met is ... you. Perhaps whatever mindset you bring with you
: is the problem, rather than "their" attitudes.
:
: The crybabies who focus on the negatives - "it's stupid", "it's
: too hard", "they think they are better than us" etc. - waste
: their energy. During the time their focus is on the negatives,
: they make no progress. The time they spend bemoaning their
: situation would be better spent on improving it.
:
: Your paragraph (following) shows no grasp of the facts:
: "the reason most people don't join the ranks of amateur radio is NOT
: because they are not interested in radio or want to operate illegally. it's
: because most amateur radio operators treat all other radio operators like
: shit."
: Fewer than .24% - that is point 24 %, not 24 percent - of the people
: in the US have ham licenses. Put another way, and in rough numbers,
: that's about 1 person out of every 500 that has a ticket here. The reason
: most people don't join the ranks of amateur radio is they are not interested.
: If there were more interested people, there would be more ticket holders.
: How many people are beating down your door to help them satisfy their
: interest in getting a ticket? (I'm assuming you do not have the negative
: attitude you accuse others of)
:
: You said "all i'm saying is, give kindness to get
: kindness and being humble will kill no one."
: I'm not so sure that your labeling of most amateurs
: as having some kind of bad attitude fits within the
: concepts of kindness and being humble.
:

Use it as a signal spotting source for OT gear. Use it as a qrp
transmitter as my OM did during WWII (key the antenna lead).
If it does not have a calibration book, regenerate one for it using
one of the available book generators from the Glowbugs Archives
(ftp://piobaire.mines.uidaho.edu/pub/Glowbugs/).

DON'T cannibalize it, if someone CAN use it, and it is in reasonably
good shape (e.g., restorable shape).

Good Luck!

Direct conversion (actually heterodyne reception dating from 1910 or so)
is one of the oldest reception methods about for continuous wave signals.

Make up a simple diode rx with GOOD primary and secondary tuning, and
LOOSE coupling. Heterodyne the BC-221 into it for reception on 160
or 80M.

Works great!

If you use the procedure I outlined, you will be soldering a socket to tinned bus wire which will work fine.

There are several places that still sell them, but most municipal electrical codes now forbid them. Reason, if the fuse in the neutral side opens but the hot side remains, you may have a very dangerous situation. If you use one of these you MUST ground the gear it is used on. I'd be inclined to just go to a 3 wire cord and put a fuse inside the unit.

<Chuckling>.....Ohhhhhh how I remember the Mohican I restored once - I'm guessing your meter (if not physically broken) likely has an open winding - somewhat different construction in that the winding is outside the case as I recollect....and is rewindable believe it or not....something on the order of 1000 turns.....In my case I remember having to unwind this salvage wire from another meter/small transformer and then rewind it onto the Mohican's meter...(unwound the old burned winding and counted turns etc). Just a side note on alignment....in the unit I worked on, the BFO frequency was quite far from the IF, too far to center, so I aligned the receiver IF offset (came out with good skirts etc) to suit the BFO...worked very well. Seems that AGC requires the meter to be electrically intact in order to function. Be careful around the transistors in this rig as they are quite obsolete now (if you're keeping it original). Check those power supply electrolytics (if it has the optional PS module)....mine were very poor....and the OEM rating of 16vdc as I recollect was VERY marginal - extra filtering (and perhaps a mod to lower the resultant voltage) is adviseable if you're wanting to listen to much SSB or CW. Neat lil vintage portable rx.

Gord - VE1AJF

3592. Help ID'ing part number TS 930S

Newsgroup: rec.radio.amateur.boatanchors

Message-ID: <3BE3382E.ED2A9449@swbell.net>
Source record: 48286
Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors

I'm trying to come up with the part number for the TS 930S relay that controls the TR relay in an external RF amplifier.

It's on a small rectangular board along with a couple of diodes and a resistor. All mounted on the bottom of the rig near the remote socket.

I have an early service manual, but the early runs were wired differently.

If you have a later 930 (3.7 mil or higher) and a service manual of the same vintage, the part-number in your manual would really help me out.

Thanks in advance

Dan W5VJ

Hi,

Often single conversion is used to describe a single IF radio. That's not the correct usage as far as I'm concerned, but you do see it used. Direct conversion is always used to describe a radio that goes from RF to AF with one mixer. Since the BC-221 is already doing this as a frequency meter fixing it up to do it as a radio is fairly easy.

I may be wrong, but I believe that R&R sold out some time ago. I
think that Lynn, N0ALO bought the paint and front panel business and
has recently sold it to Mike Shelton at
http://www.nctotalelectronics.com/
R&R also used to carry some neat and hard to find parts, such as the

infamous 18K resistor for the Johnson VFOs. Does anyone know who has these critters now? I need to replace the one in my Ranger.

Another source of front panels that was advertised in Electric Radio a couple of years ago is Ron Hankins, 555 Seminole Woods Blvd., Geneva, FL 32732 (407)349-9150 His ad said that he had a photo available on request.

Additionally, it seems the bezels were painted differently. My HQ-129X is #2 from the above list, and the bezel has a smooth finish. All the ones from #1 on the list (that I've seen) have bezels with a textured finish. The repro ones are for #1, and they do look very, very nice !!

I said "mostly". I am aware that there are tube designs with crystal filters, as well as the Collins radios with excellent mechanical filters. And there are modern solid state radios with inferior solutions such as ceramic filters. Still, the best of now is better than the best of then - the state of the art of filter design has improved. (And the worst of any era is terrible indeed.)

I also said "in most ways" advisedly. Many modern crystal filters have poor time-domain response. This makes the radios sound bad in ways that are hard to define, as well as potentially muddying high-speed data modes.

Hi Jack:

I found one at my local farm store. Seems they're routinely used for
electric fences.
If you can't find one, let me know and I'll see if I can come up with one
for you.

How about:

Non-military Hammarlund's HQ-180, SP-600, HQ-140X, HQ-129

> Still, the best of now is better than the best
> of then - the state of the art of filter design has improved. (And the
> worst of any era is terrible indeed.)

I disagree - I have a few of the "modern" good radios and I am NOT impressed. I have replaced many of them with the above Hammarlunds.

Solid State is wonderful for a battery powered porta-ghetto SW sound blaster... which is OK for most young people who don't know any better. Sony 2010 is good example - check out those tuning sounds!...chuff-chuff-chuff

DSP is only as good as the software in the chip (and some is pretty bad).

Tube equipment is hand assembled.

Solid state is robotically assembled on moving belt. "Techs" paid minimum wage have 10 to 20 seconds to align and checkout each unit.

I could go on and on... but many of us already KNOW all this...

> I also said "in most ways" advisedly. Many modern crystal filters have
> poor time-domain response. This makes the radios sound bad in ways that
> are hard to define, as well as potentially muddying high-speed data modes.

I'll define it - the words "cheap" and "crappy" come immediately to mind. That goes for the "Top End" equipment as well.

My HQ-120 runs rings around any Grundig or SONY SWBC RCVR I had in the past 4 years and it was made 64 years ago! I doubt if any of today's new solid state rigs will be around 64 years from now. Which is YET another reason to go tube!

I sold all my solid state stuff and went back to tubes...

Sign me...

Been there done that - got the solid state T-shirt... and gave it back.

Another thing about modern radios that has nothing to do with
technology but might be important to some is the fact that they all
look like bedside clock radios. Not much styling in any of the modern
stuff.

Hi, I just acquired a Hallicrafters HT-32A and SX-101A. There are two main problems. The first is mic sqeual. I have tryed several mics (none amplified.)and if I adjust the audio level pass "1" (1 being the lowest "10" being the highest..) I then get a "reverb" effect. At "1" there is no apprciable modulation as the mic is turned to low. The secound problem is low power on 10 and 15 meters..about 7 watts. I am unable to go onto the air with the mic problem of course. There is also a "Calibrate" function to "zero-beat" the RX and TX. How accurate is this function? I am new to amatuer radio and learning. Any help would be appreciated. Please respond to iron@skyride.net Thx..

This isn't an answer for you, but your problem set me to wondering about what might be done with typical computer software and hardware.

You could make a very decent complete front panel artwork using MS Word or any of several drafting programs. From that point, you could print out a very decent looking, full scale print using either a laser or inkjet printer. Suppose you print this onto a transparent film, like you do with transparencies for a PowerPoint presentation.

You could completely strip the old panel, give it a uniform base color, and then transfer the artwork to the panel. That last step is the problem, right?

What kind of media might work. First, it would have to accept ink or toner with decent resolution and without bleeding. Then, you might be able to lay the plastic onto the panel and transfer the ink, maybe like dry-transfer lettering works. Or maybe you could adhere the entire plastic sheet to the panel, with an adhesive or thermal process.

Or maybe we could use a photo process, a bit like you do with PC boards. Or might there be some way of creating a stencil mask that could be used with ordinary spray paint?

If we can find a transfer medium that's home workable, we could restore a lot of BA's. I could see the possibility of an artwork archive for BA front panels! And it would also be great for home brew projects. Let's hear any ideas about moving this forward.

First problem...are you simply getting audio feedback from the receiver speaker back to the mike? Try using headphones and see what is the result. Normal operation requires either headphones or hooking up the receiver to mute it during transmit.
The other possibility is RF feeding back into the mike but what you describe doesn't sound like that. General cures are low swr, good grounding, decent mike cable shielding and in some cases even changing the mike cable length.
Second...10/15 meters. probably needs some alignment and/or fresh tubes.
Third...calibrate is to spot the transmitter onto the rcvr freq. Since its "what you hear is what you get" its perfectly accurate. Has nothing to do with actual dial calibration per se.

Once you have the artwork ready and on a transparent film, it
should be easy to get a silk screen made from it, though it may
not be all that inexpensive. Then it's a simple matter of careful
positioning, getting the paint onto the panel, and letting it dry.

Most bookstores and public libraries have books on silkscreen
technique, from do's and dont's for artwork preparation all the
way through burning the screen, choosing the paint, to how to dry
the finished product and how to protect the result

My guess is you are getting feedback because you have not set up a system to mute the receiver when you are transmitting. On the old separate receivers and transmitters, there were two things needed that today are"automatic" in transceiver.

One is to have them on the same frequency, which used to be done with a so called spot function, [a low level transmit signal was generated so you could adjusst the rx frequency to the tx freq, or vice versa].

The second was to turn the rx to "standby" or "mute" as you trigger the transmit function. Some of us used to do that with the "human hands relay", just by switching the receiver to standby each time we transmitted. Other's used special contacts on the receiver and outboard external antenna relay to switch both the antenna and the receiver mute.

You need to be aware that the old transmitters need to be "tuned up" on each frequency----this is a mildly elaborate procedure that , if not followed, will result in your output being nearly zero, and in your tubes being damaged.

Im sure others will have suggestions for you too. Get the manuals and sit down and read them both. I think they are both available on the BAMA site. Also, if you are new to ham radio, make sure to read a lot about the appropriate antenna set up.

3618. Re: Tubes vs. Solid State for SW Receivers

As a new SWL, I have a couple observations about different technologies.

As just a general thing, I pretty much use SW for news, nothing fancy.-- BBC, Deutsch Welle, Radio Netherlands, stuff like that. So my requirements are basic and easily met with a bunch of radios. The audio quality though, with some of the old sets is superior, with large speakers and wooden cabinets and such.

Also, the basic tuning differences between analog and digital is crucial --- I like analog tuning; simply that I can tune down into the noise floor and hear weaker stations. That isn't possible with many of the popular modern digital units.

I have a panasonic sw about the size of a pack of cards, clever. I never seemed to use it much at all though, but my boatanchor gets a workout daily. I disagree with the idea that sound quality doesn't matter for short wave listening, with a good radio, fidelity is actually pretty decent.

p.s. I was asked if I knew if the RX is in "Standby" mode. During
transmit, yes. However as per manual you can "talk to frequency" and
listen to your own voice (like talkback) as one way of "Zero-beating"
frequency. In this mode microphone has to be set so low that no
modulation occurs. Of course if there is feedback during this mode,
feedback will occur on frequency. This mode is used to adjust the mic
audio also. Antenna is a G5RV running through a tuner. Tuning is
accomplished by "Final Tune" and "Driver Tune"..(there is no "Plate"
or "Load" as in the Kenwoods 520 or 830's.) I have tryed two different
Turner mics and a Astatic D-104, all non-amplified.

Well now I find that it has STB on high range (i.e., VFO won't osc there but xtal does fine). Cannot find one bad component. Astonishingly accurate low range. Frustrated wit da stoopid thing, grrrr...and if I have to change any VFO caps it may take a week to generate a new, unoriginal cal book (not).

Yes, it could be a QRP rig, and it would be a very accurate "period" alignment gen too (but it's output is skimpy).

Does anyone have E&E's Surp. Conv. Manual #1? I'm interested for how they wrote this unit up or any mods suggested then (I have #2 & #3). There is an "extra" or undocumented small RF choke in this unit, nicely mounted on standoffs that have the tropical varnish on them...and a BNC added later through a 100uuf to the pentode plate of the 6K8...(go figure ?)

> Ranger.

I am confused - wasn't the AF-67 & it's orignal supply & cable made
for & matched up to the PMR-7 rcvr for integrated operation, either
through the PS2V or the M-1070 (I think)? And wasn't a relay part of
the original cable arrangement? This is also the way my AF-68 & PMR-8
& supply are config'd...can't run one w/o the other, unless you jumper
or mod the orig cable...don't know if the original cable may have been
different when furnished with the 1070 (3-way) supply...curious.

Was the Ranger screen-modulated like the Elmacs?

Have you ever used it as an AM exciter with something, and how did it
work out for you?

The arguments previous are both all right and all wrong. I'd love to
have an SX28, or an HQ170 / 180, or a Yaesu or Icom, but, IMHO, the best
sounding and best operating radio is the one which:::::
- we are happiest operating ourselves and
- we can afford without bankrupting our families and
- fits our personal application.
When I'm travelling, I take my Grundig YB400 with the windup antenna and
when I'm working in the basement, I use an RCA CR91A with a long wire, in
the garage I have a Howard model 430 with a long wire. All of them give me
pleasure, and I don't really care about someone elses lab measurements. The
radios are paid for and fit the applications I bought them for perfectly.
Just remember - unless it's a competition, it's only personal opinion -
there's no prize!
(just my .02)

I have had Solid State and tube, Heathkit, Hallicrafters etc. I don't see any difference in reception except the solid state has more "bells and whistles". I suppose if anyone has to ask the questions if they had owned both it's a mute point. If you can't tell the difference by ear..does'nt matter..

ACtually there are a number of very good vacuum tube receivers, the
limitations on receivers from the early 1950's onward was atmospheric
noise, not electronics. Tube types that can hold their own agains the
best of the transistor units..
Drake 2 and 4 series, Collins A and S line products , the HQ180 just
to name a few. These receivers tended to have very large dynamic
range, excellent image rejection, a wide range of bandwidths and sharp
skirts.

The reality is most solid state receivers today are modeled after the
Drake 2 series.

These sets do have one other important advantage. They could take a
real beating at the antenna input and damage nothing.

From: David McCombs <dmccombs@houston.rr.com>
Message-ID: <Vj_E7.25160$Wv.606407@typhoon.austin.rr.com>
Source record: 48236

Nice Drake R-4C. No filters installed. Original paint and in good shape. All weak tubes have been replaced. Controls have all been cleaned. Unit had been sitting for quite a while so it could use a good cleaning. Front panel very nice. As it sits, an good solid 8.0. Ser# 24,546. Have been using it as an external receiver for my TR-4C. Comes with original box and packing, and copy of the manual. $235+ shipping.

Also have nice original TR-4C ser# 34,577. Works excellent with minor typical wear on it's original paint. Daily user. All tubes are good. Minimal chassis spoting. Front panel very nice. As it sits, a good solid 8.5. No power supply. $235+ shipping.

Ten Tec model 229 2KW antenna tuner that matches the Drakes perfectly. This is the gray and black tuner with silver trim and accents that matched the original Corsair I. Looks great with the Drakes. Works very well and is very clean inside and out. Inside is spotless and flawless. $150.00 + shipping.

Stuff I would consider doing some horse trading toward.
TR7A (or converted TR-7) with PS and/or accessories. Does not necessarily have to have the AUX-7 board but would like a good compliment of filters.

Thanks,
Dave K5FNG k5fng@arrl.net

Source record: 48235

The AF-67 can work with any RX. I did have an PMR-8 but never tried to mate it with the AF-67. I used a Dow Key TR switch to switch from RX to TX that is activated by the PTT or keying the 67 (CW) this muted the HQ170A-VHF. I am using the Tr switch with other gear.

The PS2V is a regular power supply not a vibro pak as with the 1070. I have never owned the 1070. The cable is a factory supplied version that came with the PS2V for connecting the power supply to the AF-67. The AF-67 is high level not screen modulated just like the Ranger.
In fact the Af-67 and 68 have been called the little Rangers...due to stable VFO, coverage, and ability to put out a signal. Mine has logged 32 countries on 10AM including FG5, FY5, JA, VK, G, and ZS.

I have driven a linear but the AF-67 is fully capable of driving a Class C amp and modulator (high level) such as 4-400A's modulated by 811A's...

I'd rather have this the other way around: use a solid state autodyne mixer (which needs no filtering) to feed a tube audio amplifier (with very good filtering). Which should be as close as analog technology will ever approach DSP receivers.

Where do you get these numbers, from the Taliban?

For example, the TOW missile has been used by the US Army (and many foreign governments) since 1970. The 100,000th missile was delivered in 1975. Since that time at least another 250,000 have been built. Trust me, they were not totally hand-soldered by master technicians. Tape-on-reel components and auto insertion have been used almost from the beginning. Much of the hand assembly was done by hourly laborers that were in some of the lower labor grades in the factory. (This is not to disparage them, it's just the way it was)

A sample of missiles built 20 years ago and stored in a bunker without any maintenance could be taken out and fired today and still exceed 95% success. Mass produced, solid-state, no skilled technicians tweaking them. Guaranteed.

If you don't think this is possible, you pick a missile, any one you want and you get in the tank and I'll shoot the missile. (I've seen them fired, but never have done one before).

According to your numbers, you have a 94% chance of living. I think you have a 94% chance of dying. Want to take that chance?

I didn't think so.

Preparing the artwork is not a trival matter. A few years ago, I corresponded with a guy who was willing to scan my original panel, touch it up on the computer, and turn it over to a silkscreen shop when ready. I gasped at his price quote and then thought to myself, "Hey, I've used PhotoShop and similar programs quite a bit, how hard could it be?"

The answer is . . . pretty hard! I spent several hours prettying up the scan of my SX-42 panel and eventually gave up out of exhaustion. I can understand why there are not a lot of people offering this kind of service. The amount of time needed to give professional results would make the price unacceptably high in the average case.

Even getting a good scan is harder than you might think. Copy shops like Kinko's are not willing to put heavy metal plates (or metal anything) on their scanners. I resorted to scanning sections of my panel on my home-size scanner and pasting them together in Photoshop.

Audio quality is important to me, too. That's why my "higher-fi" boatanchors get used regularly, while others with roughly equal sensitivity/selectivity gather dust. This has little to do with the original tube-vs-solid-state question, however. If I pipe the output of my Grundig YB400 through a hi-fi amp, the audio is plenty juicy.

Q: "Was the Ranger screen-modulated like the Elmacs?"

A: The Ranger is plate and screen modulated. The Elmac is plate and screen modulated. Both use 6L6 - or 6L6 variants - for the modulator.

Plate modulated means plate and screen modulated, since a transmitter would not fully modulate with only plate modulation.

The Ranger has an inverse feedback winding on it's modulation transformer, which
contributes to the excellent audio. The Elmac does not have a feedback winding, but it is generally considered to have excellent audio.

I ran an Elmac for years and always got excellent audio reports.

I no longer have the Hallicrafters. They were too much trouble and I
trashed them. Thanks to everyone for their attempts at help.
However I would like to take this oppotunity to give my own
experiences with the Amatuer Radio world. Since I became an amatuer I
have received little if any help in anything. I was told that this is
a "friendly" hobby. But my own experiences have shown that most of the
hams are reclusive and are never there to lend advice or show a new
person anything. This is not just my own experience but new people in
my area who have left the hobby for that same reason. I called several
persons here and all either acted like they did not want to help or
simply "shrugged" it off. This is not the first time I have had this
experience. Out of the 5 or 6 persons that attempted to help on this
newgroup..I had four who just wanted to buy the Hallicrafters Station.
It would appear that hams are more interested in their own collection
than actually helping. I am not just speaking of the ones here but
those in my own community. I have on at least three occasions heard of
hams going to widows who husbands have died and wanted to have his
equiptment "for the community" but ended up either on their own desks
or even Ebay. If I sound disalusioned I am. I would not recommend
amatuer radio to anyone especially the uninformed. Amatuer radio in my
own observation is not the "friendly" hobby it is acclaimed to be. I
am going back to being a biker. It's a better crowd of people.

Earliar I asked for help with a Hallicrafters HT-32A. I no longer have the Hallicrafters. They were too much trouble and I trashed them. Thanks to everyone for their attempts at help. I acquired the Hallicrafters HT-32A and SX-101A from a Ham who assured me that they worked perfectly. They did not, low power, feedback, mic wirng problems.. This is the secound time I have trusted a Amatuer Operator and was taken. Don't get me wrong, my fault. I should not have trusted his word. But this is the "brotherhood" is'nt it? Anyway, I asked several persons in my own community, you know, the "Elmers", they would'nt help either, one told me to read a book. Ok, what friggen book? The bottom line is..no one wanted to take the time to come over and show me what I was doing wrong. I fiddled with them for a week. Microphone, grounds..manuals..etc..etc...during the course of trying to get the station on the air, two of the "elmers" called me and asked if I wanted to sell them the set. One said.."You know they are old, so they are not worth alot" (Then why does this clown want them?..: P) I politely said no thanks, thinking "This guy won't take 10 minutes to see what I'm doing wrong but he wants them, but does'nt want to pay alot, cause they're old..uh-huh)Anyway, to make a long story short while sitting there blundering through things, I suddenly reliezed "why am I doing this crap?". The equiptment I am working on is almost as old as I am, I got suckered by a "fellow amatuer", no one wants to help me but everybody wants to buy my Hallicraters. I then took the HT-32A to the back porch and did a "B-52 Archlight". (Thats a carpet bombing run by a B-52 Bomber) at 15 feet to the driveway. BULLEYE!!! The SX-101 followed (BULLSEYE again!!). (I should have joined the Air Force, I'm Good...) Tomorrow the Heathkits Apache, SB-101, SB-201 amp go, followed by a secound wave of Kenwood 520's and a 830 and Hammerlund to ground zero. (Ground zero being the driveway). I have to admit I feel so much better. I mean that. Not because of the rigs, but because I am chucking amatuer radio.

However I would like to take this oppotunity to give my own experiences with the Amatuer Radio world. Since I became an amatuer I have received little if any help in anything. I was told that this is a "friendly" hobby. But my own experiences have shown that most of the hams are reclusive and are never there to lend advice or show a new person anything. This is not just my own experience but new people in my area who have left the hobby for that same reason. I called several persons here and all either acted like they did not want to help or simply "shrugged" it off. This is not the first time I have had this experience. Out of the 5 or 6 persons that attempted to help on this newgroup..I had four who just wanted to buy the Hallicrafters Station. It would appear that hams are more interested in their own collection

than actually helping. I am not just speaking of the ones here but those in my own community. I have on at least three occasions heard of hams going to widows who husbands have died and wanted to have his equiptment "for the community" but ended up either on their own desks or even Ebay. If I sound disalusioned I am. I would not recommend amatuer radio to anyone especially the uninformed. Amatuer radio in my own observation is not the "friendly" hobby it is acclaimed to be. I am going back to being a biker. It's a better crowd of people

Made by Worcester Electronics Laboratory in Frankfort N.Y. serial number
375, model SM-2
This was an excellent BCB DX'ing antenna many years ago. Cosmetic condition
is excellent, it will amplify the frequency you select, but the level of
amplification is down. It will have full output sporadically, I would
assume it is an intermittent connection or something not too complicated.
If you are into BCB dx'ing, this would make a nice nostaglic antenna to
have. I have a Kiwa Loop antenna and have no use for this one. I am open to
offers.
thanks
Tim

Well, my experiences in the hobby have been totally the opposite. When I got started back in the Fifties, there were at least a half dozen "elmers" in the neighborhood who helped me and my neighbor, Don, get started and get our licenses. On the other hand, I never asked any of these Elmers to help me restore a couple of 50-year-old radios. If you're into something that danged complicated, you'd just be better off figuring it out yourself, mostly. Or, if you can't, just go with modern gear that works. It sounds like you boxed yourself into an area where you didn't have the expertise, and, once again, working on radios that old is a lot more complex than asking someone how to put up a dipole or whatever.

Best of luck with your bikes...

Bob

Jimmy,

It is unfortunate that you have become disillusioned with amateur radio. I checked out your original posting on this newsgroup and counted no less than three responses from gentlemen attempting to help you. What were you expecting? I think that was pretty generous of those guys.
What you might not understand is the "culture" of true ham radio. Just as those in the biker community cut little slack to the new breed "yuppie bikers" (stock traders with lots of money, a Harley but no commitment to the biker credo), true hams expect newcomers to have interest and initiative to work hard at learning our craft. By depending on this "Elmer" business you are denying yourself the essence of what the ham spirit is about. The magazines are groups like the ARRL created this "Elmer" thing as one of their marketing ploys to grease the wheels for newcomers (and sell more memeberships). The true, knowledgeable old-timers spent hundreds...if not thousands of hours EXPERIMENTING, being frustrated, learning, reading everything they can get their hands on and experimenting more to evolve into the radiomen they are today.
When a newcomer approaches someone who has PAID HIS DUES but whines because he expected everything to be "plug and play," old-timers naturally compare that attitude to their own experiences and, understandably, cut little slack for a guy who seems unwilling to expend the same effort. Or worse, solve his problem by taking fine vintage equipment, like your HT-32 and SX-101 and pumping full of buckshot in the back yard.
I regret to say this but it really seems to me that your problem isn't so much unwilling old-timers to help you, but more, an unwillingness on your part to help yourself.

Back in the 1960s HP made 2 wave analyzers. The 302A and the 310A. The
302 covers 20 cps to 50Kc and the 310 covers 1 kc to 1.5 mc. Apart from the
coverage the differnces to me don't appear that great. Can anyone recall
using these things and which is best for which application. I'm wondering
if anyone has used either as a VLF receiver. I know they don't have AVC and
wonder what other mods might make sense.
Tnx

You spent an "ENTIRE WEEK" working on it, Wow! You give up real easy. I have often spent months of even years working on gear, and read books, ALL the books I can get.
If you have so little time or patience for ham radio, maybe it would be better if you find a hobby more suited to your personality, like "street-louge", or something like that.

An "Elmer" that will not assist you, is NOT an Elmer at all.

Is it a "friendly" ham radio you lament, or is it the fact that you lack the knowledge to work on gear that should have been retired(mostly because you don't have the time to read a book) Or would you rather have an "elmer" come ALL the way over to YOUR house to do the work FOR you? But then, these guys ARE old, and not good for much else anyway.

So, if you HATE ham radio this much, go back to being a biker, blow-up ALL of your OLD gear, and hit the road.
Perhaps ALL those guys you "ASKED"(likely demanded) help from, would rahter you did too.

The big grey one...tuning on S-107 and a zillion others of the HT-37
era. Please let me know if you have one available for sale.
Tnx es 73,
Bill WX4A

Hi,

The JRC 545 is a radio with a number of odd little things it does. Most of them are related to the limited dynamic range of the DSP. Some people find them to be a major problem. Others run the radio for years and never notice them. I don't find them to be a major problem on the radio I have doing what I do with it.

I don't have a RX350 (yet) but I would guess it's a pretty good radio.

Another radio in the same price range as the RX350 is the good old Drake R8B. It is a fine radio and often it is easier to listen to than the JRC. It's front panel isn't as snappy as the JRC and it is not quite as feature rich. I would definitely put it on your list though.

If you have the room and the inclination there are also several boat anchors that might fill the bill. Certainly the R-390A (or R-390) can be a very good radio. If you want to move a little forward in time the Racal RA6790/GM and Harris RF-550A are *very* good radios. The Harris tunes a bit odd for band cruising though. All qualify as boat anchors since they are literally large enough and heavy enough to anchor a boat (at least one of my kayaks ...)

I don't know where you are located but if there is any way to get to a store and listen to a couple of these radios it could make all the difference. It's certainly a lot cheaper than buying one of each :)

Enjoy!

I bought my desk KW 13 years ago at an auction, and I wouldn't part with
it for 100x the price I gave. It is the crown jewel of my boatanchor
collection.

Knee jerk reactions here, without a doubt. when buying anythng, from cars and homes to ham gear, the rule is CAVEAT EMPTOR. Given some time and effort the gear could be made to work.

If you would like to buy stuff off the shelf working, go to your favourite "candy" store and get the latest rice box with a warranty.

Part of this fine hobby is the option of fixing things yourself. I've found that to be the most reqarding aspect of the hobby in the 33 years I've been a ham. Sad, but true, that most hams now day don't have that skill, but don't write us all off because of an abundance of applliance

operators. Amateur radio is a continual process of learning, not just a slip of paper with strange combinations of letters that allows us to LEGALLY talk to others around the world.

I think the ham radio community should read this letter and take a hard look at itself. I am a second generation ham, whose father taught radio theory to many up and coming hams back in the late 50's. Maybe we all need to give back to the hobby in whatever way we can, and not sit back glumly and reminisce how good the sunspot cycles have been. Here we have made a very bad, and probably unchangeable inpression on our neighbour.

I have for sale a Collins F 455 Y 21 2.1 Khz filter. Part # is 526 9337 7
00.
This is the standard mechanical filter for the KWM-2s, 75S-1, and 32S-1s.
If you need one, make me a reasonable offer. I am not sure what these are
bring now days.
This one is in very nice shape.
Thanks,
Charlie Hugg, K5MBX

3681. Can I get a shop manual on this?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-04 17:46:33 UTC
From: markt@sdc.org
Message-ID: <3be57e97.8405266@newshost.sdc.org>
Source record: 48123

I'm looking for technical data on a Motorola Service Radio. It came in a grey metal enclosure with speaker, volume and squelch knob. It's about desktop size and only receives one channel on police band.

The ID tag says: 2-way Radio--Motorola, Model: L03FNB-1002A. Serial No. A54230.

Like I said, it functioned as a Police Band monitor, had one crystal channel and about 8-12 tubes.

I did a photofact search but no luck. Motorola may not keep any records on it as I recall during a search years ago. I'd like a schematic and a shop repair manual.

Any ideas?
Thank You,
Largo

Jim ... I am truly sorry about the way you were had. You know that ham radio is just a cross section of the population. I would venture to say that most hams would agree that some of the most bizarre people they have known were, in fact, hams. I have personally known the gamut from men-of-God to multiple murderers in my 36 years in this hobby-service. The experiences you write of were all done to me. It is an ongoing process of learning like life. Don't chuck it all because some people don't have the "Ham Spirit" ... whatever that may be. I am sorry that you don't belong to my club where there is a sense that we help the other fellow and really don't worry about license status other than getting others licensed through our classes. Drop me an e-mail if I can help you out .... God Bless 73 Tom KI3R

Tom (and all);

I feel you and all the others who tried to re-assure Jim about his bad experience are wasting your time.

Mind you, I'm not defending the scum-sucking asshole that sold him 'it works good' equipment that turned out to be bad; but, having realized that that was the case, why did he not put forth the effort to repair it (obtain a manual or two, seek out our help here) instead of destroying that which he couldn't or wouldn't understand.

A week, he claims, is time enough.....sorry, Jim, but I've spent weeks and months on single pieces of equipment.....day after day of slogging thru old books, on the phone, hunting down parts.....the usual drill.

I get the sense that 'Jim' is a member of the MTV 'I want it and I want it right now' generation; the ability to appreciate the operation of a piece of equipment all the more because of the effort involved in getting it going seems to be lacking.

As for the low-life vultures who obviously were more interested in 'taking it off his hands' than helping him repair it, may they rot in eternal hell for driving this potential member of the hobby away.

In closing, may I invite Jim, if he ever has problems with another piece of gear, to e-mail me or call me (my number is just an e-mail away, Jim), I may not be able to fix it via long-distance, but I'll try to point him in the right direction.

and, as Forrest Gump says: 'and that's all I've got to say about that'

I spent a WHOLE WEEK trying to get it going!

I paid no attention to the postings here that were suggesting help---I
want it DONE FOR ME!

Nobody would come and DO IT FOR ME!

I'd rather be riding hogs with my grimy buddies!

I threw them over the balcony and broke them so nobody else could have
them!

That'll show them!!!

I'll brag about it on the Internet to show everybody how powerful I am!

QUESTION:
When will you take the flying leap head first so WE CAN LAUGH at YOU?

We don't need people like you who want everything done for them instantly!

Seems to me you don't like the message so you blame the messenger.
It's not just me. several here have left because no one wants to help.
Too busy sitting on their behinds warming a chairseat. As far as not
"helping" ,yself...thats horses**t. I've read all I could,
experimented but when I came to a dead end no one there. Seems amatuer
radio talks a good game but can't pitch worth squat.

I received no response from you for my offer to assist (via Internet).

If you wish to burn money in this economy, then you are quite a wealthy man.

Personally, I'm unemployed and have not asked for payment of my offers to
assist
individuals with older equipment.

As for your experience with amateur operators, I think
you will find its specific people - not the amateur service.
I can point out people in commercial broadcasting,
two-radio business and CB that also fit your experience.
(I have not even mentioned the gun and used car businesses !)

Sheeeesh.... You must live in Southern California,
the "Me First, Screw You" state. I've been a ham for
nearly 30 years, have done literally hundreds of deals
and I bet I could count the bad ones on one hand.

Hi Chris,
While the quality of some of the material on BAMA is marginal, the
info you need can be easily read by printing page T4XBP8.GIF rather
than trying to read it from the complete PDF file or on the screen. I
just did a printout on a HP LaserJet 5L and it is perfectly clear and
readable. However, if you still can't read it, you can use the
following:
Reading the jacks from left to right on the T-4XB
1 - Injection cable goes to jack 1 (Inj) on R-4A
2 - AntiVox/Sidetone goes to jack 3 (AntiVox) on R-4A
3 - (up and to the right) Mute goes to jack 2 (Mute) on R-4A
4 - (up and to the right) RCV Ant goes to jack 5 (Ant) on R-4A

From the speaker to jack 4 (Spkr) on R-4A.

Ken K4XL - Replace "invalid" with "net" to reply.

Here's guy that is totally tied up in himself. "I don't have the time
to read a book.." Hate to rain on your parade but ..yes I do read..and
no..have little tolerance for jerks. You "assume" alot..If you had
"read" the message it "lamented" the fact that the vast majority of
you guys sit in your shacks warming the cushion with your behinds and
really don't give a crap about "The Hobby"..you want that "Collins",
it's a joke. When someone needs help..you blame them. Then get on a
Newsgroup on your "puters" and rant about the "unknowledgable" ones.
Seems to me you do alot of ranting behind microphones and keyboards
but don't do squat in the real world. Maybe you guys need to get out
more. Or put more vents in the shack. Lots like carbon monoxide damgae
to me. And as far as "demanding" help..no..I asked..again and again.
Just got tired of the BS. Have a nice day and get some fresh air.

The HT-32A manual has the correct interconnection diagrams to the SX-101A

Go to the Boat Anchor Manual Archive, Al Parker, W8UT donated the HT-32A
copy to the archive.

This page has all of the interconnections between the HT-32A and SX-101A for
proper operation
ftp://bama.sbc.edu/downloads/hallicra/ht32a/ht32a04a.tif

The external antenna relay referenced in the diagrams usually a DOW KEY
Relay
with 110 VAC or 12 VDC coil (if you do not have one, new ones can be
obtained from many amateur dealers or DowKey)

This assumes that the receiver and transmitter are properly working
separately.

You might want to question your ISP about missing messages here on this
group. It came thru here also at 9:49AM Sat (-0400) and I saw several
other replies to your request for help.
I'm not condemning you for not being able to find the problem. When I
said simple, I meant that the problem could indeed be something simple
that you may have overlooked not being familiar with the radio.
You haven't made any points here, Jimmy, and I'm surprised anyone would
still be offering you any help. Hopefully if your bike starts
sputtering you won't go throw it off a cliff like some raving lunatic.
And yes, I know how to ping a server but not an individual address.
Adios,
Bill

Exactly the same problem occurs with bikers. Did you buy a 50 year old bike and expect others to help you restore it?

I collect old radios and restore them. They take a great deal of time. However, a number of amateurs expect that since I have spent a lot of time servicing these radios that they should be able to buy an old radio and have me fix it for them - all because of the joy I get in repairing radios. I do, generally - but then I do not have sufficient time to work on my own equipment.

Riding a bike is easy. You just get on and pedal. The most complicated thing there is to do is change a flat and pump up a tire. And, there are even solid tires, now, so you do not have to do that.

A 50 year old transmitter is just like a complicated 50 year old car. If you purchase a 50 year old car that is not running, you cannot get on the internet and say my car does not run, what do I do? The problem you described with your Hallicrafters sounds like lack of familiarty with the equipment - which means read the excellent instruction manual. Bicycling does not require that. I suspect that the offers for the Hallicrafters were made because you had not bothered to read the manual.

I have handled numerous estates for widows of deceased hams in the area. In each case, I sold the equipment and gave all of the proceeds to the widow. In a few cases, I have wanted something and obtained an independent appraisal and fully disclosed the information to the widow. I have friends who do the same thing.

In short, you get out of a hobby what you put into it. You may want to go down to the local ham store and purchase a modern - simple - rig. Then, read the manual. Then, get on the air.

Well, I don't deny that ham radio often draws people who are introverted. Sounds like you might be more happy in a Toastmasters or Dale Carnegie-type club.

I should also mention, some of the most outgoing people I've ever met have been hams, so I wouldn't just condemn them all as introverted ambulance chasers.

But I'm still a little confused -- you say the gear basically worked fine, but because you couldn't solve the microphone feedback problem, you took a shotgun to your gear? I looked at some of the replies you received for the ht-32 -- did you try any of the ideas out? One guy even told you where to find the interconnection instructions for the ht-32 and sx-101.

Sorry to hear about the ultimate fate of your sx-101. That was my dream receiver, as a kid.

By the way, if you're really looking for human interaction, the chili cook-off crowd generally has a rave-up time.

Best regards,

Bob

From IP 208.14.147.14

Getting out of ham radio..I have a Hallicrafters HT-32A and SX101A for sale. Original manual for the receiver..copy for the TX. Also dow key relay and Turner 454C mic and connector.$450.00 plus shipping. These units weigh about 100 lbs altogether. Do they work?..have'nt a clue..can't find a free freq. or anyone who knows anything about them.

Interesting as this topic is, what does this have to do with
tubes versus solid state for SW receivers? A prior poster in
this thread seemed to imply that solid state circuitry was
the reason that so many cruise missiles failed to detonate!
(which is ludicrous, bordering on the bizarre.)

I guess we need to replace all that solid-state circuitry
with vacuum tubes. Maybe our computers will run better if we
replaced the Pentium 4 with the equivalent number of vacuum
tubes? :^)

Tubes have their place, and solid state circuitry has its
place. I wish to know their respective places in high-end
SW receivers, not cruise missiles.

Jimmy, sorry you gave up ham radio, it is a good hobby and a useful service,(sometimes)..It seems that you were in to some pretty deep technical stuff there..maybe the reason these other hams did not help you is that they probably new less than you did and did not want to admit it..You can enjoy the other things that ham radio has to offer..you don`t have to repair some old stuff that probably didn`t work too well when it was new, take it one step at a time and have fun.. A ham for 52 years, W4PQW Harold

Perhaps you should get your CB out again.
There are two problems here. The lowlife that sold you "working" equipment and you. You should have asked for a refund if the equipment was not as stated and especially if you knew you would not have enough knowledge to repair it.
From the replies here I don't believe you really gave anybody a chance to help. One week is certainly too short a time (unless you don't have a day job) to really assess and correct a problem.

I had an opportunity to buy an almost new 145 for almost nothing ($75) back in the days when you could still get one almost new. I gave it a good whirl, but I owned a 170A at the time and the 145 was far from being impressive beside the 170A. Sri, but I can't compare it to a 150 or 160.
If I had to rank it among Hammarlunds (or even Hammerlands) considering the HQ-100 as a one and the HQ-180 as a ten, I'd give it maybe a 6 or 7. Like most Hammarlunds, it has improved with age :-)

Wow!

As an Elmer and radio pro, I have assisted a great many new
and experienced hams forward with their projects, but if they
want it DONE they gotta pay! And restorations cost so much
they are best left as an ongoing HAM PROJECT.

I don't know who told you that people would be tripping over
themselves to put you on-the-air but who knows, there are
suckers out there. I've seen it happen before, but THEY
usually get burned out when everyone in town pushes their
junk on 'em to fix.

Actually, this is why I liked the Novice license. Ham radio
just isn't everybody's cup of tea, and at least the Novice
ticket gave people the opportunity to try it out. If you really
hate it, there are other things to do.

BTW, my main radio is a TS830s and I have used most of the
gear you described at one time or another, but I'd go nuts if I
had to resurrect all of them at the same time, and so would
most people.

Think about it for a minute: If you were drowning, I bet most
people would want to help you, but if you were thrashing
around like a maniac, they might not want to dive in with you.

Jim, ac6tk

Hi,
The SM2 was designed by Joe Worcester in about 1970, and written up for the AMDX hobby clubs. I'm the Reprint Manager for IRCA (International Radio Club of America), and have two reprints covering the SM2 construction as a homebrew project, and an associated article covering the theory of shielded loops. The SM2 used a 12-inch ferrite rod and two bipolar transistors. The input transistor amplified the loop signal; the output transistor used an emitter-follower configuration for a low-impedance output to the AM receiver.
Using the reprints, the antenna should be easily repairable, assuming the ferrite rod is not cracked. I don't think a 12-inch rod is available anywhere, anymore. (Of course, two shorter rods could be epoxied end to end to make a longer rod.)

Steve,

Where might one get copies of this reprint?

me too. i have a bunch of loose parts in boxes and i am looking for an elmer to help me make a rig and get on the air. i have asked several people but they did nothing for me. i am willing to connect a wire or two myself but only if someone talks me through it step by step. instead all i get is people telling me to read books or go to websites. if i wanted to read books and go to websites i'd go to a library. why can't they understand i just want to push a button and talk on ham radio. why can't hams help me do that? the reason i think is that they are selfish and introverted. what would be best is if someone could come over to my house and just make it all work for me. but no they are too selfish. what a hobby it truly sucks. now i am going to spread lowfat cheese all over my box of parts and light the whole thing on fire and spit on it while it burns. that'll show those selfish hams.

That is a good point, and also the multiple tuned stages were needed to provide a reasonable degree of image rejection at the higher frequencies for most single-conversion designs.

Source record: 48174

Loooking for a mono Collins radio audio control board. I don't know the model number but it has one single VU meter in the center and about 8 or 10 large black pots along the bottom of the front panel with corresponding keys above each one. It was a popular board used in AM stations in the early 60's. Looking to purchase if mostly complete. Also any identifying information on this model if available. I'd appreciate any knowledgeable guesses.
Thanks,
Jack

Meisner Signal Shifters for sale: Deluxe model and an "EX" Model. Originally bought them for project/resoration, but never got around to it. Don't know if they are working, but they are in good shape and look complete $150 OBO for both units.

Harvey Wells Bandmasters TBS 50C and TBS 50D xmitters with exernal power supply (1) - good shape with orig. black crinckle finish $200 OBO for both

Harvey Wells T90 xmitter - no power supply, used with homebrew supply which has since been pressed into service elsewhere. $100 OBO

Hallicrafters HT40 xmitter - good conditiion $75 OBO

If I can find the manuals, they all go with the rigs.

Additional info please contact me at TAM166@aol.com

i know jimmy its terible. i later had a big linaer and a ham radio that dint work good too. the mike suqealed and there was no roger beep at all. plus i couldnt find a clear channel to talk on even if i did get it going. the watts meter read 800 but the glass things inside got real hot and then sparked like the muffler on a 65 triumph bonneville. also i didnt know how long a pole to make for my diapole. i spent a whole week and a half trying to figur it out myself! when i asked for help from a ham they told me about books too. imagine! if this was a biker gang they would come over and do it all for me! but no. these hams they are inroverts or somthing. they are not open and giving like dudes i met in the county jail who are willing to share their last rock with you. lets face it jimmy this ham thing is not a hobby where you can get people to help you. you would think they would want more people to be hams and treat them with more respect.

Hi Tim,
I am interested in your loop antenna. Could you please describe it to me
because I have no idea what it looks like? I also have no idea of its
value. I have a fascination with loop antennas and would like to have it
to play with. Could you tell me a range of what you think the loop is
worth?

Have a nice day
73 de ai4a

Message-ID: <20011105075644.28653.00002904@mb-cg.aol.com>
Source record: 48188

Very good physical condx. Have never put on the air. Bought to collect and occupy shelf space. On a scale of 1-10, the DX-60A is a 7.5 (little rust on the transformer) and the HW-16 is a 9. Cabinets on both in great shape.

$75.00 for DX-60A, $85.00 for HW-16. plus shipping.

Excellent condx. Have not put on the air, but was in daily use when I purchased 6 years ago. Ha been stored in my shack. Non-smoke airconditioned room. have the original manual. This is very clean. Due to the weight and condition, I would suggest pickup only. Newton is one hour NW of the Charlotte, NC airport (near Hickory).

$175.00.

Sell it as is, without the work of parting out, will net ~ $ 100

Don't bother separating, I always think you get less with the 516F2
when you do that - since new direct replacements exist and are plentiful.

Wayne you have a few good choices.

1.) I just saw a few New Old Stock (NOS) Alliance model (U100 series)
rotors on eBay
that were made for this service. I also saw the thrust bearing NOS, also
listed, if you need this accessory.

2,) You can purchase rotators directly from one of the 2 U.S. repairs/
service center.

Here are there web pages:

http://www.rotorservice.com/

http://www.rotordoc.com/

Greg

If you do find an old junk box one that does not work, either of the 2
service centers can totally recondition as well

I do not usually recommend "usenet" newsgroups for new amateur radio
licensees

Usenet is a "volunteer" get what you please Internet style "chat" room

I do not ask technical questions in a bar either.

I'm afraid you'd be wrong about that - while there are still a few contesters using tube receivers (almost all the Drake R4C which is indeed an excellent receiver) most are using solid-state gear.

In large part this is due to the convenience factor. There are no tube receivers available which will automatically control the frequency of a solid-state transmitter. Keeping the number of controls necessary to change frequency to a minimum is critical in a contest station. Having separate frequency-control knobs for receiver and transmitter is not acceptable. Nor is having to re-resonate the tank circuits when changing bands - something that's required with tube transmitters. Also, computer control of frequency is quite important, a feature not available in tube sets.

There is no good reason someone couldn't *build* a solid-state transmitter which could be controlled by a tube receiver, or add a frequency counter with RS-232 interface to a tube receiver. Except that with the high cost of small lots of parts, it's way too expensive. Even if one did have the time and tools to do it.

Modern solid-state receivers do have very good performance, IMHO nearly as good as the best tube sets. Factor in the operating advantages and the tubes really don't have much of a chance.

No Gary, he likely just likes a fat buck as well as the rest of us
(whomever admits it or not), and was probably priming the pump, and is
disillusioned by that particular gear. :-)

If I start smashing my pristine vintage gear, will I drive up its
price<BG>?

Jimmy, please post us binaries in an appropriate place, showing the
dunged-up BA's in yer driveway (some of which would survive the drop
with mostly only cosmetic damage). Ya know, if U were serious, you'd
take the 12-lb sledge to them instead. :-) I'd also like to see some
streaming vid of U heaving the HT-32 into any kind of interesting
trajectory, as it is one heavy muthah to throw.

But you know, there really are a lot of assholes on the other side of
such complaints, too...and I don't doubt that he felt treated just as
he describes.

Odds are that it's a Harvey Hubble (or Hubbell) connector if
it's a twist-lock. Try Allied (www.alliedelec.com).

hello everyone,

Jon's question appears to be whether there is a sensitivity/selectivity/audio (as a package) advantage of tubes or transistor in shortwave receiver design. since he is not talking about memories, digital tuners (etc.), i would be inclined to say they were INHERENTLY very similar. An EE could design similar units looking at the basic receiver sections (rf amp, mixer (rf oscillator), if amp, detector, and audio amp). now if we go on to talk about signal amplification via tubes versus op amps (operational amplifier IC's) that is another story.

Jon also asked which was better in the REAL-WORLD: there i would have to say solid-state because of SIZE. small size means more amplification units: for example you would need over a dozen for even simple AGC designs... not to mention hundreds of thousands of switching transistors for digital memories etc.

Jon went on to ask which models were representative of these 'best' units... a good start may be to look at the best Drake tube units of yester-year and compare them to the best Drake solid-state units of today. here is a link for the Drake museum:
http://www.dproducts.be/drake_museum/

Jon also wanted to know about current radios which have a good cost relative to their performance, for this i provide this link:
http://www.rnw.nl/realradio/rx_current.html

my 5 cents (inflation),
phil :)

Well I am grateful for the education & memory recalibration, Dave. I installed several of these mobile for others long ago, but I'm not licensed & so there are operational things I don't know & manhy other's I've forgotten. But I was surprised to go over my AF68's schem more carefully and find that you're correct about it's mod config - I guess I'd been confused by the way it's run through the connector. Not to mention the colored-pencil job its former owner did to all the doc's (why do some people do this??).

I apparently had a memory reversal as well, forgetting all the gyrations we'd gone through to wire up the 1070 supplies (which in fact came with no cables, versus the straight AC supply which had avialable the one you cite) & relay & all the extra hash caps, etc. Time wounds all heels, they say<G>.

It turns out I've had a complete AF68/PMR8/1070 station for several years, from an SK for whom I'd originally put it in. Finding the little thing is plate-mod might be enough to make me throw up a wire and get a license. Been working with the gear all my life but never liked ragchews & ham-type activities. It does look pretty clean on the scope loaded into a dummy. Fired up the rcvr last night & considering the neglect it's had, it's FB though isn't tracking accurately yet (all those perverse little slugs from both sides of the chassis to mess with, that are probably all stuck after 53 years, praying you don't break one of them<G>).

Hard for me to imagine great reports from the crude carbon mikes being used then, but did you find its dynamic mike setting well matched?

I don't know the Rangers up close, but was first surprised by the comparison since the Elmac is so much lighter & is smaller. I suppose the outboard supply goes a long way to resolving the difference.

Thx again.

3767. Which valves in a HP 608E signal generator

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-05 21:50:19 UTC
From: arnoldg@c2i.net
Message-ID: <3be70853.6321636@news1.c2i.net>
Source record: 48059

Hello,

I want to buy a HP 608E signal generator because I have heard much
about these and they look very nice. I have been searching the net for
a schematic, but can't find anything. I was wondering what kind of
valves they use. If the valves are very unusual and hard to get (and
expensive...) I may change my mind.
I also wonder if this generator can put out a FM modulated signal in
the low end so one can align IF circuits on 10.7MHZ?

Best regards,

Arnold Goksyr

DEMOSTENES - N6899 Balestrand, Norway
Tlf. +47 5769 1340 Fax +47 5769 1267
http://www.demostenes.no

Thousands of different valves in stock as well as
sockets,transformers,books,caps,resistors and
other components. Web site is updated every week.
You can order on-line.

It is _extremely_ unlikely that you're in or have been in any
danger at all, as long as the meter cases are intact and none
of the glowing material has got out.

As long as they are intact (no cracked or broken glass), you are probably
okay. The military removed
many sent to gov't surplus (i.e. Fair Radio)

If you are concerned about the small amount of radium that was used,
replacement meters
are available from Fair Radio Sales.

http://www.fairradio.com/

You can also contact Dave Medley (R390/URR) for consultation, if you desire
http://home.att.net/~d.j.medley/

An EE could design an autodyne mixer w/no filtering, directly producing
audio by using solid state, such as a PLL tuned to the carrier frequency,
that would not drift. It would be like exalted carrier SSB. Or are you
going to say that this could also be practical with tubes? Were there any
tube receivers with decent AFC?

> and audio amp). now if we go on to talk about signal amplification via tubes

While solid state allows for inherently dissimilar alternative designs
not realistic for tubes, I'd rather not use solid state for amplification.

My TS-510 military unit uses two coaxial style UHF triodes in the oscillator and the buffer amp stage. Rest of the tubes are common. Unit drifts like crazy and has leakage issues. Not my favorite generator.

Sounds like you've had enough Jimmy, so adios it is...maybe ham radio isn't for you and especially boatanchors. Although, I can't help but think you are being a little too sensitive. For those who are planning to stick it out, boatanchors are prone to problems. Part of owning and operating these beasts are getting them working...a sense of pride exists among those who do this. A person selling a piece of gear may have picked up a the piece at a yard sale, went home and checked it for output or sound without checking every detail of operation. That piece of gear may have ended up on the market advertised as working and the seller may not have known that there was a problem. Some problems crop up due to incorrect operation. There are some great reflectors that deal with issues directly related to differend brands of radios. For those interested, check out www.qth.net. I may be wrong but I've never seen anyone let down who asked for help on a reflector. As for Elmering, I never had one nor was I ever offered. I don't hold it against the ham community...part of the problem was me. In '72 when I was first licensed...who in the heck wanted to elmer a 15 year old snot nosed, non-boy scout, long hair who started with a CB? When I relicensed in '94, I was too old to elmer. Most of the guys these days who are elmering, focus on the teen crowd. Sure there are some out there who will elmer someone more mature but you have to seek them out at your local clubs. Now the fun part if you can hang with me for a few more minutes...the motorcycle thing. Yup, you can find some rightous folk among them and yup, you can find some real jerks too. I got my start (18 years old) on a Yamihaha. I thought it was the cats ass! I found a rather abrasive welcome by many who thought me and my Yamihaha looked like a cats ass! So when I was 21, I got my first sportster. After a year or so, it was a Superglide. Then after years of piecing it together, a beautiful '46 FL knuckle. It took 2 years just to find some FL cylinders that would work. I would unknowingly buy a warped frame, cracked springer and a set of tanks that was covered with bondo from bike folk...just like me! After a few weeks of riding with pride on my '46 knuckle dream bike, an acquaintance warned me of a plan by several bike folk to steal it from me. I took my bike(s) to a relatives house. A few days later, my place had been broke into and trashed...nothing stolen but trashed. The cops blew it off because nothing was stolen. I had to sell the '46. Several months later, I dropped my Superglide in an intersection when someone ran a red light. I estimate at least 35 different cars were waiting at the intersection. I struggled to pick myself and my bike back up and hobble over to the curb. When the light turned green, off they went...one person finally did stop and roll down their window and asked me if I needed help. That was the last time I rode, so for me, adios it was and yes, I gave it a good hard try. Without going into

detail, I tried sport fishing after that. You talk about kept secrets, unfriendly anglers, boats plowing down the sound without giving a rats ass thought about wake... What's my point? There is good and bad in everything...I bet if I hung with the Goldwing and Zebco crowd, things may have been a bit lighter for motorcycling and fishing. I choose to run with the more esoteric crowd. Those who are in the boatanchor crowd seem to be a bit more esoteric than some of the hams in the MANY other areas of amateur radio. Hopefully if someone else encounters similar problems they will look elsewhere in the hobby...CW, packet, dx, nets, contesting, VHF/UHF, elmering, clubs, special events, ARES, and many others. 73, JP

3776. Re: Can I get a shop manual on this?

Newsgroup: rec.radio.amateur.boatanchors

Message-ID: <9s79qq$7ou$4@woodrow.ucdavis.edu>
Source record: 48078

if you snap a digital Email picture, reduce it in file size so it doesn't jam up to much down load time... then email it to me at the above address with the NOSPAMPLEASE removed, i'll tell you more about what you have and how to find a diagram of it. Your initial post reads like it's a common research or pre-motrac era receiver.

cheers
skipp

Too sweeping a statement. Certainly a tube receiver is not about to
control a modern synthesized rig. But what about older geat where a
common VFO frequency of 5-5.5MC was used?
Keeping the number of controls necessary to change
> frequency to a minimum is critical in a contest station. Having separate
> frequency-control knobs for receiver and transmitter is not acceptable. Nor
> is having to re-resonate the tank circuits when changing bands - something

>
The above is again over generalized. For example, the CE200V was a
tube set that required no tuning.

The only tube in any of my gear is the CRT for the PC monitor.

Maximo:

i was saying that amplification could be done with tubes or transistors with basic designs; however, like you say its a matter of being practical because of the size, power, etc. requirements.

you stated you would rather use tubes for amplification... a hybrid unit? it appears the problem with some DSP units is that they rely too much on the DSP as a fix for a poor front end or the DSP does not have good enough resolution (bits).

phil :)

Carefully clean the crystal with some alcohol and rinse it clean with warm water. No way you could have damaged the crystal. The oil will destroy its Q, but is fixable!!!! Be careful not to crack the crystal during cleaning, and avoid getting finger oils on it when handling.

Message-ID: <3be76234.8474505@news.indpdnce1.mo.home.com>
Source record: 48075

Sorry if this is too off topic...but I have a nice NEC laptop which makes a good shack PC, logging computer, etc., which I'd be willing to trade for boatanchor of similar value.

Here's the info: NEC VERSA 4080H laptop with accessories. Pentium 120MHZ, 40MB RAM, sound, 800x600 TFT color LCD and 1GB hard drive running Windows 95. Laptop works fine and is cosmetically like-new. Laptop includes swappable CD-ROM drive and 3.25" floppy, Touchpad mouse, onboard stereo sound, infrared port. Also includes XIRCOM PCMCIA Ethernet network card with 10-base-T adaptor. Includes two working batteries. Also includes two (2) AC adaptors, NEC external battery charger, and separate NEC thumb Trackball device. Includes battery pack adaptor so you can swap the second battery for the floppy/CDROM and operate TWO batteries at once for extended power. Includes leather TARGUS case, and separate leather case for storage of floppy, CD-ROM, or spare battery pack. Laptop is fully intact with all accessory panel doors. Keyboard is clean and operates without sticky keys or other problems.

$275 + freight.

Tnx & 73

Thank you for the tip,

I just got a couple of prices that were slightly better than those offered.
It is strange trying to get such a light duty rotor as the antenna literally
weighs about a pound.

Probably a good idea not to buy boatanchor gear even if it is working perfectly, if you don't know how to fix it when something does break, which it will sooner or later.

Although you could enjoy the gear while it's working, while studying books and poking around inside to learn enough so when it breaks you won't be starting from square one. --Mike K.

FOR SALE Vintage British Army Wireless Set C12 Transceiver.

The C12 Transceiver,otherwise known as Wireless SetC12, evolved as a replacement for the earlier "19 Set" transceiver.
Except for the fact that the C12 Transceiver is HF only (the "19 Set" also had VHF),it is basically a much improved version of the 19 Set and is interchangeable with in most situations.
Overall,the C12 has a better performance than the old 19 Set.
The C12 consists of an AM and CW sender/receiver.The set is of excellent build quality and far superior to the 19 set in this respect. Transmit and receive frequencies are continuously tunable.Also,the Transceiver may as an additional facility,be pre-tuned to any of two alternative frequencies and can be switched instaneously from one to the other,without re-tuning.To provide this facility,all tuning controls are duplicated,aerial tuning included and a single switch is used to transfer the tuning from one set of controls to the other.The transmitter and Receiver are tuned automatically to the same frequency,as per modern practice,which makes this unit emminently suitable for "nostalgic" use on AM nets.
The overall frequency coverage is 1.6 -10.0 Mc's.
The C12 transceiver which we have for sale is in all original condition,the interior in particular being near mint.
Power requirements are straightforward and any PSU with outputs in the following ranges will do nicely, as the voltages are not at all critical.230-270 volts dc(receiver section supply),370-430 volts dc(transmitter section supply),and 12 volts filament supply.As we happened to have a 250 volt supply handy,we powered up the receive section,which not unexpectedly,worked extremely well.
Included with the C12 transceiver is the correct harness for the set,comprised of interconnecting cables,junction box,headphones and microphone,all of which are in as new condition.
Also included is a copy of the very comprehensive User Handbook and a full schematic, which, among a mine of other useful information,includes details of the connections for the power supply.The correct multi-pin connector for the power input will also be included.
As you doubtlessly already know if you appreciate classic AM sets,the C12 is a very nice quality unit and this one is a particularly good example.We have already commented on the internal condition and would just add that externally,it is of very smart appearance.The price for the transceiver and accessories as indicated above,together with a copy of the user handbook,schematic diagram and INCLUDING the cost of air freight to the USA, is $455 US Dollars.
If you would like us to email pictures of the set or if you require any additional information,please do not hesitate to ask.
Thanks for your interest.

FOR SALE British Military C12 Transceiver.

The C12 Transceiver,otherwise known as Wireless Set C12,is basically a greatly superior version of the earlier "19 Set" transceiver.
Except for the fact that the C12 Transceiver is HF only (the "19 Set" also had VHF),the C12 is interchangeable with the 19 Set in most situations.
Overall,the C12 has a better performance than the old 19 Set.
The C12 equipment consists of an AM and CW Transmitter/Receiver.The operating frequency is continuously tunable. As an additional facility,the transceiver may be pre-tuned to any of two alternative frequencies and switched instaneously from one to the other,without re-tuning.To provide this facility,all tuning controls are duplicated,aerial tuning included and a single switch is used to transfer the tuning from one set of controls to the other.The Transmitter and Receiver are tuned automatically to the same frequency in accordance with modern transceiver practice,making the equipment eminently suitable for enjoyable operation on today's AM "nostalgia" nets.
The overall frequency coverage is 1.6 -10.0 Mc's.Power requirements are not at all critical and the Transceiver may be operated from any conventional power supply which is to hand and which has the following outputs:230-270 volts dc for the receive section,370-430 volts dc for the transmit section and 12 volts for the filament supply.Included with the unit is the correct multipin plug for connecting your psu to the transceiver.
This particular C12 transceiver is in all original condition,of very smart external appearance and is in near mint condition internally.As we happened to have a 250 volt dc supply handy,we powered up the receiver section,which not unexpectedly,worked extremely well.
Included with this C12 is the correct harness for the set,comprised of interconnecting cables,junction box,headphones and a microphone,all of which items are in as new condition.Also included is a copy of the very comprehensive User Manual (which in addition to containing a mine of useful information, includes full details of the power input connections)and a full schematic.
As you will doubtlessly already know if you are interested in classic AM sets,the C12 is a very good quality equipment and this particular one,is an especially nice example. The price for this C12 Transceiver, together with the accessories as indicated above,and INCLUDING the cost of Air Freight to the USA, is $445 US Dollars.
If you would like us to email photographs of the set or if you require any additional information,please ask.
Thank you for your interest.

> you stated you would rather use tubes for amplification... a hybrid unit? it

I'd prefer to have separate components, as much as possible, say:

1. computer for database & control
2. solid state autodyne mixer for direct conversion from ECssb to AF
3. tube amplifier w/ good filtering

> appears the problem with some DSP units is that they rely too much on the
> DSP as a fix for a poor front end or the DSP does not have good enough
> resolution (bits).

As for DSP units that simulate autodyne product detection and so are
either not doing a good enough job or wasting silicon, when the job could
be done better or simpler by a PLL providing the exalted carrier.

At least you know where to go for repair. Unless you have the shop and parts to fix it yourself,

these are the only 2 remaining commercial shops I am aware of. Support them, or get use to going to

Japan for your rotors and parts - like the transceivers.

Very nice, about a 9, clean and working. I completely re-capped this radio, fixed the output circuit, repaired other small defects and it's on the air. I put a new 6146 final in it as well. Sounds great. This is the A-75 model, I believe, with the blue case...I think it was the last one made.

80-10 meter AM-CW, crystal controlled. Will work with the WRL VFO but not well with others like Heath or Johnson.

$125 plus shipping from Minnesota (About $20)

Larry, N0XB
Northfield, MN

From: Larry <retire@rconnect.com>
Message-ID: <tugciekrngpdbf@corp.supernews.com>
Source record: 47944

Fully electrically restored original DX60. I've re-capped it and replaced many other components. Cosmetically, it's about a 6, with some peeling of the paint and a few scratches here and there. 80-10 AM and CW. Crystal controlled or use the accompanying HG10 VFO.

VFO is in good condition. Someone very expertly installed a low voltage power supply inside the cabinet so it doesn't require power from the radio. It works well, and comes with the manual.

I'm interested in selling the pair together.

$125 plus shipping from Minneapolis--about $25 Buyer pays actual shipping never more.

I'd assume it's not really dangerous, but you can't know on my guess, can you? I've learned from correspondence with George Gonzalez there are a couple of different isotopes of radium used in luminous paint, one with a half-life over 1500 years and one with a half-life of almost six years. Obviously, the long half-life stuff would still be as hot as new. I have no idea what type, or mix is in your meters. Either way, the paint would have dimmed by now because the phosphor wears out.

This is an interesting subject. You might find some interest a hospital or university where someone can accurately measure the radiation output from the meters.

FOR SALE:

AKAI model M8 REEL-TO-REEL, Stereo tape deck in excellent condition.

This is a classic commercial quality unit with seperate
left and right amplifiers, metering and electronics.

The case, including the cover, is in great shape as are the
mechanical and electronics. The gray tolex/vinyl covering is in
beautiful condition and the deck works fine, other than the rewind
does not run.

Pictures available on request.

Will sell for $75.00 plus shipping

3806. FS: APS-104 Radar modulator unit

Newsgroup: rec.radio.amateur.boatanchors

I have a mil surplus modulator unit from APS-104 search radar (likely from B-52 bomber - 1960s vintage). Was used to fire a large pulse magnetron (in another unit). Contains a 4C35 thyratron, four 3B29 HV rectifiers and a few smaller tubes, oil caps, relays, transformers and other parts all in airtight aluminum canister. Also have copy of service manual (extra $5 for all, n/c for just the basic schematic & info). Still in original box, but used, collector's item, $55 (prefer pick up - box exceeds UPS size limit).(For an additional $20, I can shave down the foam insert and modify the box for UPS shipping, just takes a lot of time & effort to do this, and will cost at least another $40 to $60 to ship 105 lbs.) Great collector or experimental item. Located in southeast Alabama, 36330 zip. Email or call 334-347-5281 day/eve.

That's what I figure, but George Gonzalez had his R-392 meters checked with a calibrated geiger counter, and they are still putting out a fair amount of radation. Maybe the paint manufacturers quality control was inconsistant, and some batches are hotter than others. I dunno. If Joe is worried, he could get the meters checked. If it were mine, I don't think I'd be bothered much.

The 608E uses 3 unusual tubes. The RF chain has one each of 4042 and 4043 pencil triodes and a EC8010 miniature triode. The rest of the tubes are common types such as 6080, 6AU6 etc. It requires a couple of hours of warm-up time before it becomes stable enought to use, in my experience. Professional labs used to leave them on 24 hours a day. You can also phase lock it with the HP 8708A synchronizer which is a quicker way to get frequency stability. It has a voltage control input but no internal FM. If you are using a 8708A, there is a FM/PM input so you can modulate it properly with an external source.

Its lowest frequency is 10 MHz so you should be able to use it to align a 10.7 MHz IF but there are better FM generators around.

Good luck,

Morris

> checked with a calibrated geiger counter,
> and they are still putting out a fair amount of radation.....

A very small amount of radiation will make a counter sound
like a brigade of machine gunners.
I can put a 10 millirem source near
my counter and it goes BRRRRRRRRRRRRRRRRR!
But you have to put that in perspective:

It takes about a 50 REM *prompt* dose to show *prompt* effects
from radiation in 50% of the exposed population,
and at that level it's a slightly elevated
white blood cell count- About like getting a cold.
It takes 400 REM prompt to reach the LD-50 level
(lethal to 50% of those exposed after 4 weeks).

A millirem is one one-thousandth of a REM. And the 10 millirem
reading is a CONTACT reading. The dose goes down as the cube
of the distance, so it drops off dramatically as you get further
away from it. At a distance of just a couple of feet, the reading
is near background.

Radiation dosage is cumulative, meaning it adds up on ya.
Most current studies suggest that you can accumulate larger
doses over a long time with less bad effects then a big dose
all at once, because the body repairs the damage.

So- if I put my 10-millirem source in my pocket next to my leg and
carry it 24 hours a day, it will take a little over 208 days for me
to accumulate a 50 REM dose. And since it's a long-term dose,
I'll probably die of old age before I ever see any effects.
If I separate the source from me by even a few inches,
the time to accumulate a significant dose becomes years.
If I'm not within inches of it 24 hours a day, the time
becomes more then the average lifespan.

This is somewhat arguable- if you're hitting *exactly* the same
cells over and over, you would have a higher risk of effects.
This is why inhaled or ingested particles are bad news-
they lodge in one place and hit the same cells for a long time.
But you're very unlikely to hold your R-390 meters right
up against the same patch of skin for an extended period.
A separation of a few inches and even that tiny risk goes away.

In short- Enjoy your R-390. Just don't pry open the meters.

73 DE Dave AB5S

Hello. I acquired a VERY unique crystal set! It is shaped like a real pipe organ with the pipes and keys, etc. 1 ft tall. Made of wood, all old brass screws. Has a lady singing figure holding a songbook that is slid accross a brass flat piece that contacts the tuning coil under the keys! Has EARTH and AERIAL screw terminals at the top on the sides behind pipes. Has 4 push terminals above keyboard that say PHONES on a manufactured plastic piece. Missing what appears to be the label. ANY ANY info on this is much appreciated. I have been a ham for 25 years and never saw one like this. More details if needed.

> Hammarlund's first?

The HQ-145 is double conversion on the highest band, as is the

HQ-160 on some bands. The 150 is single conversion only.

The 145 sounds good on SSB, but you have to ride the
RF gain just as on earlier models. It doesn't have
the "built in HC-10" product detector like the 170 and 180
do.

Palomar Preamp P310 - Ebay

Covers 160 through 6 meters. I bought this at a hamfest a few years ago for $50 from a nice fellow who said that it worked perfectly. I haven't used it, so I decided to sell it. Just to make sure it worked, I plugged it in and nothing happened (rats). I opened the cabinet, and found no visible evidence of damage. (Even the fine wires to the toroids are intact, so I suspect a transistor or possibly a bad solder joint.) I don't have time to work on it. The cabinet is in excellent condition. I'm selling it strictly "as is".

I will be glad to provide additional information. Contact me at w4tq@mindspring.com

Pay by money order or PayPal. UPS shipping charges will be estimated based on the weight of the packaged item and your shipping address. I will send you the UPS tracking number, which you can track via the Internet. The item will be shipped immediately upon receipt of funds, and will be packed properly, to help assure safe delivery.

For auction on Ebay, click on:

3827. Reference Texts for tube RF design

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-07 02:21:34 UTC
From: George Kavanagh <gk05@mediaone.net>
Message-ID: <3BE89B5A.EDB854A2@mediaone.net>
Source record: 47969

Can anyone provide suggested texts for tube RF design? I'm particularly interested in info on interpreting tube data sheets; design protocols for RF tube transmitters and linear amps; determination of tube RF input impedance & appropriate load (transformed antenna) impedance, etc.

Have Radiotron Designers Guide, and several old ARRL handbooks.

Is there anything out there that is deemed "gospel" in this area?

Anything "highly recommended"?

Are any old ARRL handbooks recommended over others?

I am an old f*** BSEE getting back into ham radio after 30+ years.

Thanks in advance,

George Kavanagh, KB1HFT

I used a 310 as a VLF radio; pretty sensitive but a pain to constantly adjust RF gain to keep from overloading detector.

There are some SELECTIVE LEVEL METERS made by others which offer SSB (U and L), CW, AM detectors and which are cheaper, at least on EBay.

There's so little on VLF to justify a separate receiver, I think.

Dave -

A few ideas for your Drake 1A, which I hope you keep running !
[an eBay special, at least it fell into the right hands !]

Call Drake, they may still have the specifications on the transformer.
(amperage for the filament winding, changes in production, etc.)

Then contact the following vendors for replacement transformer pricing
(you can ask about "rewinding" , but a new replacement may be cheaper)

There are individuals that have recently advertised rewinding services,
but I am unaware of their quality or expertise to recommend to you.

I would specify that the transformer company supply a 120 VAC primary
winding

The 1A is old enough that it may have had a 110 v or 115 v specification.
Minor point, but most U.S. power is now at 120 VAC - which leads to higher
voltages on your secondary capacitors, plates, etc.

A bigger issue for high voltage in RF amplifiers, rather than most
receivers. BUT since you are replacing it !

Cin-Tran, Cincinnati, Ohio was one supplier of Drake Transformers
If they did the 1A transformer, they may be best first bet.
http://www.cintran.com/

Heyboer Transformers, Grand Haven Michigan
They supplied Heathkit transformers and possibly Drake
http://www.heyboertransformers.com/index.shtml

Surplus Stuff - I get lucky here sometimes
(like their current surplus Collins power transformer)
http://surplustuff.com/xfmr.html

Peter Dahl
Peter can wind or fix about any transformer.
Solid business that supports amateur specialty/restoration needs
May not be the cheapest price, but solid quality and backs what they sell.
The amplifier guys love him for saving large investments !
[His bid customers are broadcast industry, government and military]

The internet has confused a lot of "communities" in this way. Ham radio ain't the same everywhere
you go. You may have the misfortune to live in a place where there are either few hams, few hams
who share your interests, views, and background (radio related and other), or just few hams with
BA tech savvy *and* the simple courtesy and helpfulness (there are bottom feeders among us, same
as everywhere else in this world; hence those "OMs" offering to take the HT-xx/SX-xx off your
hands because its "old" and no good anymore) that are the order of the day in the ARS. The
internet makes it seem all good, or all bad, and all the same everywhere, when it patently
is not.
We could go on about changes in "modern" society etc. ad naseum, or about persistance, motives,
and instant gratification (the latter having little or no place around BAs), but if you have to
make a judgement call on an extremely diverse group of a half million people (counting US hams
only) in a few months exposure, you are setting yourself up for disappointment, frustration, and
failure. Lighten up, get *on the air* (HF, not FM repeaters) and you *will* find what/who you are
looking for. This is supposed to be FUN!

I mentioned this in my other post in this thread, but it bears repeating: the internet is a distorted representation of ham radio. Believe it or not, there are a lot of hams who don't even use email, or who don't overlap their internet use and radio hobby. I agree we all need
real live help now and then, a flesh and blood elmer, especially when you run into a brick wall with a problem that you can't solve with your reading (usually limited) test gear, and trial-and-error know how. Nice to stay disconnected from kilovolt B+ and avoid melting the plates on your brand new pair of 833s. Having said all that, the internet isn't a fair or accurate representation of amateur radio, just a few niches within the larger hole. Because of
the virtually free and universal soapbox, the net attracts those hams (and others) who are the
biggest obnoxious, insulting, selfish, childish loudmouths and ne'er-do'wells amongst us (I am
not suggesting that all, or even most, or even that many hams on the internet are this way,
just that those of us who are like it here, like they like 3950. . .). If you have a very specific question, request, or need, NGs and elsewhere on the net are good resources for new(er) ops, but there is no substitute for getting to know other hams on HF, local/regional
nets especially, and building relationships, elmer/"elmee" among others. Hams really are quite
a bit more honest, generous, friendly, patient, good-humored, and helpful on average than the
general population. At least that has been my experience, far and away. Still that's not a reason, not a good one at any rate, to expect the help and attention you want, when you want
it, delivered in a style or manner to your taste.

Hello
Does anyone know where I might be able to download a schematic for a BC-625AM, also known in the UK as an RAF T5017 - 100-150Mc/s AM aircraft transmitter? I picked one up very cheaply but with major bits missing so I'd like to identify what I have and haven't got, some history would be interesting too.
Also still looking for a high res schematic for a TCS where I can read the component numbers.
Thanks

John

You may also try a few E.F. Johnson two-way shops. They usually have big parts bins, and you would be surprised of some of the parts they have (New Old Stock).

I would replace with a nice 3 wire grounded in the color your desire. Restorers that
are purists do keep the power plug, but also make sure the chassis is electrically grounded.

Well preserve Lafayette Radio TE-21 Tube Tester...like new (1963) checks tansistors too.

Built in a beautiful suit case....

The TE-21 is a deluxe vacuum tube tester design for portable or counter use.. The roll chart provide a listing for over 1000 tubes...

comes with the manual...$50 plus shipping

Need a picture let me know....

1960 300 pages like new.....$15 plus book rate shipping

3844. Needed-Schematic for Elmac PSR-12 DC Power Supply

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-07 15:44:46 UTC
From: Mark Martindale <markmart@nospamjas.net>
Message-ID: <OFcG7.73$M_2.45253@newshog.newsread.com>
Source record: 47985

I have a Elmac PSR-12 dc power supply that was used with a PMR-8 receiver that I sure would like to get going. If anyone has a schematic for this supply or maybe a PSR-612 that you could send me I sure would appreciate it. I have looked at BAMA and the other manual sites and have came up with nothing.

Thanks for the help,
Mark Martindale

3845. FS.RACAL Dual Diversity Unit for RA17/RA117 (MA168)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-07 15:47:34 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <tuilo9rtlbop38@corp.supernews.com>
Source record: 47986

For Sale, Racal Dual Diversity Switching Unit MA168

The Racal Dual Diversity Switching Unit,Type MA168,was one of the last and most useful accessories to be made by Racal for use with the RA17 and RA117 series of receivers. It was designed by Racal engineers to ingeniously overcome the problems of signal fading.A job which it does very well.

Essentially,it is an electronic switching device, which automatically selects the greater of i.f.output,from two receivers,fed from two different antennas.
The unit is fully transistorised,has it's own built in power supply and will operate from both American and European mains voltages.It is designed to work with ssb,cw and rtty signals etc.,up to speeds of 1000bauds.
The two signal paths through the unit can be monitored,by two meters on the front panel.

This is a very smart,compact, 19" rack mounting Racal unit, which is only 1.75" high.

It has been checked, tested on air,and is in full working order.
A copy of the very comprehensive Racal manual for the unit is included with the Dual Diversity Switch.

We would highly recommend this unit,which as already pointed out,does a really does a great job of
bringing up fading signals.

These diversity units are quite scarce now,so here at radio-exports in the UK we are rather pleased to have secured another one.

The price,which INCLUDES the cost of packing and air freight to the USA,is still only $385 US Dollars.

For more information if required, or to order,please contact Graham Leo
info@radio-exports.com
Thank you for your interest.

>In short- Enjoy your R-390. Just don't pry open the meters.
>
>73 DE Dave AB5S
>
>
>
>
>
>
You're right. The slight dangers of dropping the radio on a foot or having it start a fire far outweigh the radiation danger from the meters. But, I did mention George Gonzalez's input, and I ought to quote him exactly:

"I wondered about this myself a few years back. Luckily I knew a guy in the local University Health Physics department. He came over with a calibrated geiger-counter. At a distance of 6 inches, my R-392's S-meter (looks identical to the R-390's S meter), was giving off 3 millirems per hour."

"That's not a lot, but after 4.5 hours a night, that's 1666 hours, you've used up your max allowable yearly dose of radiation (5,000 millirems). That's the USA guideline, some countries set the bar much lower."

I'll assume Joe is farther than six inches away from the meters. Still, 3 millirems at six inches sounds like George's R-392 meter would have a much higher contact reading than 10 millirems. So I'm wondering if some of these batches of luminous paint were alot hotter than others.

November 7, 2001

This will be the final reminder that the W8MMQ Antique Radio Page has moved.
Please update your bookmarks and web site links.

The address is now:
http://www.qsl.net/w8mmq/

There is a new feature on the site called the Radio Experimenter's Corner,
featuring vintage radio articles for experimenters and kit-builders. I am
open to suggestions. If you have an idea for this new section, please let
me know.

Visit the Radio Experimenter's Corner:
http://www.qsl.net/w8mmq/radioex/

And, over 1,200 radio mod files are listed on the site as well. If you have
any mods to submit, just email them to me and I will add them to the list.
Tip: If you can't find what you're looking for, try searching in the
/qrz_mods directory.

Over 1,200 Radio Mod Files:
http://www.qsl.net/w8mmq/mods/

Again, this will be the final reminder about the web site move, so make sure
you have the correct address. I want to thank Al Waller and QSL.Net for
freely hosting amateur radio web sites!

73 de,
Dan, W8MMQ

> The dose goes down as the cube of the distance

Hi. I'm interested in learning more about dosimetry. Clearly the radiation flux drops off as the square of distance; why does the dose vary as the cube? Is it because it is measured per unit of body volume? Thanks.

Mike

From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <9sc2upggg2@plutonium.btinternet.com>
Source record: 47997

Simple pre-selector consists of parallel tuned circuit with random
wire antenna and receiver tapped down coil.

Enter diameter and length of coil former (toilet roll tube?),
tuning capacitor maximum pF, mid-band frequency, antenna length,
receiver input resistance.

Program will tell you wire gauge, number of coil turns and where to
tap things into. Also 20 dB bandwidth.

Download in a few seconds from website below.

I think the ideal would be a tube front end (ability to handle static charges, etc) followed by a solid state mixer and digital PLL VCO for tuning. Follow that with solid state IF stages followed by DSP circuits and finally a tube audio circuit :) That would be optimum.

Joe,
Just be sure when you mount the r-390 in a rack cabinet, that it is mounted above waist high, otherwise, well you get the picture or less just say it will never be dark in the bedroom....enjoy your 390, but as others have mention before, if you uncertain, I do have a rack cabinet that still has an opening that is perfect size for an R-390 and I will be more than happy to allow you to unload that very very heavy unit to me. I might even help a little with the shipping...hee hee. Enjoy the unit! One thing to keep in mind, that you will by now notice that most of the 390's have outlasted their owners....hmmmm could it be the meters.....

I have a the Raytheon Geiger tube setup I rigged up to run off a charged
500uf 450 volt cap with HI-Z phones.
It goes a little nuts right on the meters but at 2 feet its just atmospheric
clicks.
I have 2 R-390's
The Collins is the one that still glows, The Motorola USA built one doesn't.
I have gotten so spoiled with the R-390, I cant use anything else they all
sound so awful

FUNNY: many responded to take the radios off my hands, one wanted to trade a
new Sangeon LOL !
The Motorola is for sale at $300 ....buyers choice of meters
The bandswitch needs jiggling on 2,3,4,5MHz bands beyond that its works
fine, it also has Langford SSB.
I dont have time to restore it to museum status.
jOE

My Granny had a big windup Westclox alarm clock sitting by the bed for maybe 30 years that was almost bright enough to read a book by once your eyes adjusted to the light. I think if there was really something to this "scare", R-390 meters would probably rank lower than the natural radon that comes from the ground in many areas.
Sleep well...or get one of those tinfoil suits for bedtime.

Jack -

Unlike Collins, Heathkit and Drake - I have not yet found companies
"specializing" in Hallicrafter's restorations (for hire).

I would suggest posting your inquiry with the 2 Hallicrafters Collector
sites
and other Hallicrafter mail reflectors

Hallicrafters Collectors International web page can be found at:
http://www.w9wze.org/

Chuck Dachis Hallicrafter's Collector
http://www.hallicraftercollector.com/

You may wish to post your request on the Hallicrafters "Tech Talk" mail
reflector
tech-help@w9wze.org

or on the hallicrafters mail reflector on qth.net

You may also wish to contact Dave Robbins, who has a nice collection, for
advice
w4idx@mindspring.com

Some SX-11 sites that I found (yahoo search)
http://pages.cthome.net/nord/SX11.htm

http://hjem.get2net.dk/helthansen/Hallicrafters.htm

A very nice restoration of a SX-28 restoration by W8UT
http://www.thecompendium.net/radio/sx28.htm

Nostalgia Air has schematics for many Hallicrafters radios
http://www.nostalgiaair.org/NostalgiaAir/Riders/HAL.htm

Boat Anchor Manuals Archive
http://bama.sbc.edu/hallicra.htm

Good luck, de w9gb

Is there such an animal as a $250k HF receiver ? If so, I'd like to see one
and see what makes it so expensive. I have seen a $25k receiver but that's the
most expensive I've seen.

>
>Assuming you have a lot of money to spend then solid state wins every

Dean -

I would try the normal surplus dealers
(Fair Radio, Lima Ohio; Leeds in Brooklyn, NY; and in Texas, etc.)
Sounds like the specification for an HW-16 or DX-60B transformer
----

Try Surplus Stuff - I got lucky here with their current surplus Collins
power transformer
http://surplustuff.com/xfmr.html

Here are some of my standard look-ups - at least for the telephone call

Cin-Tran, Cincinnati, Ohio was one supplier of Drake Transformers
http://www.cintran.com/

Heyboer Transformers, Grand Haven Michigan
They supplied some Heathkit transformers
http://www.heyboertransformers.com/index.shtml

Peter Dahl
Peter can wind or fix about any transformer.
He may not be the cheapest price, but solid quality.
http://www.pwdahl.com/

FOR SALE:

HAND-CRANKED MAGNETO GENERATOR! Produces
120V AC. These will provide about 20-30 Watts depending on
your cranking speed!

The size is about 3" diameter and 3" deep with retracting handle.
Fluke freq meter shows around 20 Hz on one pair of terminals and
around 60 Hz on another.
You can mount these behind a sturdy front panel with a single
hole and the large nut provided.

Will sell for $25.00 each plus $6.50 USA shipping

Picture available

3884. FS.RACAL Preselector/Protector MA197

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-08 11:12:37 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <tukpthhsdqmbe4@corp.supernews.com>
Source record: 48026

FOR SALE RACAL MA197 PRE-SELECTOR

This accessory was designed by Racal to achieve two specific objectives:-

Firstly,to bring about a considerable improvement in the front-end selectivity of receivers such as the RA17 and RA117, by introducing a high degree of pre-selection.
In real terms,the use of this unit will improve the selectivity to such an extent that a nearby signal (5% off tune),will be attenuated by 80dB's, in the range of 2-24Mc's.A most effective way of sharpening the performance of a RA17,RA117 or indeed many other receivers.

Secondly,use of this unit solves the problem of operating any receiver (not just RA17 and RA117 receivers), in the vacinity of high-power transmitters.Use of the MA197 will effectively protect receivers from front end damage or even burn out,since it will withstand r.f. signnals of up to an incredible 4volts!
This makes it a very valuable item to have in the shack, for effective use in front of all makes of "electrically vunerable" modern receivers,and not just Racal sets.

The MA197 is designed for standard 19" rack mounting.Operation is from either
100-125 volts or 200-250 volts.
This one is in good ,original,unmodified condition.We have tested it on air and
it is in full working order.

The MA197 is yet another excellent example of the versatile and eminently useful accessories to be made by the prestigeous Racal Company.
The price,which INCLUDES the cost of packing and of air freight to the USA, is $480 US Dollars.

If you would like more information or wish to order,please contact GrahamLeo info@radio-exports.com

Thank you for your interest.

3891. WTB: On/off Switch R4b

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-08 17:23:49 UTC
From: rs2bk@aol.com
Message-ID: <20011108122349.23568.00001911@mb-fw.aol.com>
Source record: 48033

Looking for the on/off switch that mounts
on the back of the function switch for the
R4b. I think the R4a uses the same.

3893. Trimm Inc. Chicago

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-08 18:27:25 UTC
From: stanb@dial.pipex.com
Message-ID: <slrn9ul71s.25t.stanb@citadel.metropolis.local>
Source record: 48035

Hi there,

Not strictly boatanchor, but can any of you knowledgable chaps from the
US of A tell me anything about Trimm Inc. of Chicago? I have a pair of
headphones by them - Type "B", with olive green cloth covered headbands,
so might be ex-military.
Just curious...

Here is the Headphone Museum !
http://members.aol.com/oldradjo/galleryt.html

It appears that Trimm moved from Chicago to Libertyville, IL which is
northwest of Chicago
I have also seen the reference to the company as ACME Trimm (later
acquisition ?)

Correct History / Legacy of company ?
http://www.trimm.com/history.html

I am working on a Hallicrafters S40 that needs a switch replaced.
The switches on this radio are all secured with a circular nut with ridges
on the edge like a dime.
Is there a tool for this type of nut or do I make do with pliers?

Thanks,
Jeff

IIRC, there was a tool in the Allied catalog back in the 60s. It
may still be there.

What I've always done is loosen the hex nut on the back of the
panel, then remove the knurled ring nut. But IME they've all had
a hex nut on the back side of the panel to set them at the right
depth so that just enough threads stuck out to take the knurled
ring nut.

If it's just the ring nut and the switch, then masking tape and
pliers are your friends.

They are telephone ringer generators. That is about all they are good for. Used in field telephones ?? or the
old phone systems before the dial telephone.

3905. SWR Meter: Vanco, check Ham or CB Antenna - Ebay

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-08 22:42:20 UTC
From: Dan Long <w4tq@mindspring.com>
Message-ID: <9sf1p9$hm1$1@nntp9.atl.mindspring.net>
Source record: 47847

SWR Meter: Vanco, check Ham or CB Antenna - Ebay

This meter is in good condition. I compared its calibration with two different $150 meters that I have, and it compared very favorably.

For those who aren't familiar, this meter checks antenna operation by measuring the ratio of reflected power to forward power. If the ratio is high, it indicates that the antenna is not correctly matched to the feedline or to the transmitter. The meter will also show a high ratio if there is a bad connection.

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1294175977

Pay by money order or PayPal. UPS shipping charges will be estimated based on the weight of the packaged item and your shipping address. I will send you the UPS tracking number, which you can track via the Internet. The item will be shipped immediately upon receipt of funds, and will be packed properly, to help assure safe delivery.

Note concerning operation:
To operate, the output of the transmitter is connected to the bottom connector, and the antenna is connected to the upper connector. The switch is moved to the right, and the knob turned counterclockwise. The transmitter is turned on. The knob is turned to the right until the needle is aligned to the set point on the scale. Then the switch is turned to the left, and the SWR is read from the top scale. The SWR should be below 2. Then turn the transmitter off.

I will be glad to provide additional information. Contact me at w4tq@mindspring.com

Jeff -

There should be 2 indentations that are 180 degrees from each other on the
nut.

This is where the "tool" would be place to turn these. Pliers will mar up
of the cabinet
paint and take the finish off of the nut. I do see the tool now and then at
automotive
stores and hamfests.

That said, you can use a pair of "flat" needle nose pliers with nylon tips
(or soft cloth over metal pointed tips)

Just be patient

Greg

My S-40B has trim washers behind the switches to protect the panel. If yours does too, use gas pliers, etc. to get the max surface area on the nut and not bugger it too much. If someone hasn't put Herculean torque on the nut, it should come off OK. Also, the other comments you got about loosening the hex nut INSIDE the panel are quite appropriate.

Saw this on Ebay, I've got my hands full with some Morrows, and a
Hallicrafter 274.
I'm not a big fan of posting auctions on here, but this one would be a good
project, a decent price right now, although how a transmitter can play well
though is beyond me. ;-)

Source record: 47861

Hey Jeff, there is a special tool for these ring nuts, but it costs about $25.00. You can do what I do, just find you a good, repeat, good, set of small flat nosed pliers, then buy a can of "plastigrip", this is the stuff that you dip tool handles in to give them a plastic coating. Take the pliers apart and dip the tips of the pliers into the plastic coating. This will give you a non-slip, non-marring surface with which to grab the knurled ring. It works for me!! Thanks,

First examination hmmm

OUTSIDE CASE
Will require repainting, NC Total Electronics or W4PNT

BACK PANEL

SO-239 antenna connector will need replaced (broken insulator)

2 wire power cord - rubber appears brittle and cracked (replace grommet with proper sized strain relief and new 3 wire line cord & plug)

Drilled holes on back panel (remove modifications installed and fabricate new back panel)

Additional modifications appear on lower bottom, review and restore (as appropriate)

FRONT PANEL

Remove incorrect screws on both sides

Overall appearance of front panel good

Clean knobs, replace non-standard one (if any)

Well that's not even looking inside !

Jack -

I have done a bit more research for you. I would seriously
look at Old Radio Doc, owned by Bob Eslinger, KR1U

http://www.oldradiodoc.com/

He indicates they are now working on communication receivers of this era.
He also has extensive restoration services for parts.

Old Radio Doc was featured in the August 1994 QST article.

3924. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-09 06:15:55 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <9sfsar$pn6$1@news.hawaii.edu>
Source record: 47867
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.antenna

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any amateur radio-related message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information

posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis- trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is NOT the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists
==========

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent. This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Source record: 47876

Comment: "Why not do what one of the experts restorers (Chuck Ripple) does... use silicon diodes?"

Response: Silicon diodes can wreak havoc in older receivers and the indiscriminate use to replace vacuum rectifiers is an invitation to disaster for a number of reasons.

When these old radios were designed, the power lines used 115 volts. Much of the gear was specified to run on 105 volts, so even at 115 volts, things were a little bit on the hot side. That was ok, though, because tubes were cheap and readily available. Today, power lines run closer to 125 volts. When you substitute silicon diodes for the vacuum tube, the voltage drop of the vacuum tube is bypassed - resulting in voltage that is even higer on the the other components and tubes. Some builders have "solved" this problem by including a dropping resistor with the silicon diodes.

But, that is only half the problem. I have repaired a number of Collins 75A4 receivers that had very low sensitivity and other problems. And, the solution was always the same. Someone had replaced the rectifier tube with a solid state replacement. When the receiver is turned on, the high voltage instantly comes up to full voltage. Since the other tubes have not warmed up, the peak voltage is much higher than design voltage and the silver mica coupling capacitors gradually get leaky. Eventually, the grid on the if stages goes positive and the receiver is effectively shut down. The silver micas need to be replaced and the original tube used.

Additionally, the instant high voltage applied to the elements of the tube, under load, severly stresses the tube. That might be ok if tubes are cheap. Consider what expensive transmitter tubes with cathodes do - they use a delay before the tube can be operated. Receiver tubes can use the same delay to protect the elements. The delay in the start up of the 5Y3 or 5U4 is close to the same delay of the other tubes in the receiver, acting as a built in delay circuit.

I would only consider using solid state rectifiers to replace vacuum rectifiers in a receiver if I ended up with a correct high voltage and I used a solid state delay circuit to delay application of high voltage to the tubes in the receiver. Anything less is an invitation to premature failure.

What you say has merit, no doubt, however Mr. Ripple has been doing this mod for R-390( ) receivers for a long time. Both my R-390's have 1N4007's in them (past 5 years) and do not have problems and assume that one will not, hopefully, develope. Your scenario is, however, entirely appropriate for "consumer" grade equipment, not the ilk of R-390's, et al.

Hi,

I'm in need of the receiver mode switch for the Gonset
G-76 AM transceiver. I'd be glad to buy a junker with
the switch.

Thanks,

Jim

Like Lamb said
That a sure way to destroy a R-390, the inrush is murder.
To add, I also believe the oscillator circuits run hotter with the silicone
and void there temperature compensation.
I absolutely HATE drifting receivers !

I dont want to recap half the receiver, install inrush limiting,
as well as take a chance on it's stability (it's perfect..... I am picky)
Some other issues mentioned by Lamb.

Well, I certainly respect Mssr. Lambs comments and, as I said, they are relavent. I was speaking from experience with the R-390A. I'll add, also, that the latest (last?) issuance of the applicable SPAWAR (nee NAVSHIP) manual shows diodes replacements for the rectifier tubes. Again, mine work fine and have continued to do so going on 5 years, now. I will mention, however, that I did change out the suspect VQ cap that DC blocks the mech filters!!
If the tubes are readily available, then by all means use them and save the trouble of installing or modifying anything.....

3943. RCA 5762 vacuum tube F/S

Newsgroup: rec.radio.amateur.boatanchors

New old stock, RCA 5762 external anode air cooled triode. Never been installed or used. Appears to be in perfect condition, but I have no way to test the tube other than to measure filament resistance. Great for vintage tube collectors or as a broadcast transmitter spare.

I had two transmitters that used those: a BC5H and an FM10B. The latter is landfill now, the former is probably in South America. As of about seven or eight years ago, Econco was charging about three hundred bucks to rebuild those suckers.

Somehow, I managed to have two freshly-rebuilt ones end up in my garage, but I found out that even KQED long ago got rid of its TV transmitter that used those venerable tubes.

No...on the cap, there is a code that denotes its value, i.e. SBE6PS-S50, SBE6PS-S20, SBE6PS-P10, SBE6PS-P25, etc...
I've seen a chart somewhere (not in my Ovaltine:-) that decodes these values. That's what I'm looking for..

I have two SX42 sets awaiting restoration. I could use a cabinet for one (missing); but I suspect you might someone who would interested in restoring that radio. It is a mess, but most of the plastic looks intact, the parts are all there. A lot of work, but some folks would love the challenge. I'd give it a home, but the shipping would be more than the parts are worth.

I hope you find a home for the radio. They are awesome sets!
PLEASE, don't dump it!!!!!!!!!!

Peter

Once again new deal at RAT shack.
I am followed around the store by a salesman trying to hawk a cellphone, Sat dish, Car Stereo, and Radio Shack credit card.
70% of the parts shelves are gone and replaced with plasma balls...junkstore stuff.
I go to pay ....they want my Name, Address, Phone, a say NO WAY.
I have a blank PC board and some fuses and some FET's for a loop preamp I am building
(everything else I wanted is gone from the shelves) and special order.
This new manager stops the girl at the register and says we cant change that a hundred bill for parts, credit card only.
He wants my Name, Address, Phone, SS#, Credit Card.
I get change at the bank, go back he says "Sorry, I still dont have enough change" please leave the store
What the hell is going on ?

I am also told Tandy is shifting from hobby to more of a "The Wiz" type of sales. (phones, Sat Dishes etc)

GC makes the tool you are looking for, in two sizes as there are apparently
two sizes of knurled nuts used on switches.

The GC tools are a bit chintzy. I had a local electronics jobber order both
sizes for me about two years ago. Best method is to use a regular hex nut
on the back of switch (rear of the panel) and tighten with a narrow width
open end wrench, if space permits.

Joe,

I am not familiar with the R-390 but the tube 26Z5 makes me want to ask. Is it a typo and you are looking for a 25Z5? Read twenty-five, meaning the filament voltage is 25 volts. This tube is somewhat common to post war domestic radios with a series string. Is it a 5R4 you are looking for?

You'd better shop around for prices on "restorations", or you might find that the work costs several times what some of these sets are currently selling for.
Send an SASE to Bill Turner, 117 Pike Street, Saint Charles, MO, 63301;
or to: Mike Tobin, Rock-Sea Enterprises, PMB 241, 323-110 E. Matilija St, Oja, CA 93023 and request the Pocket Resource Guide for Antique Radio and Phonograph. I'm looking at a THREE page list of restoration shops across the country who do the work you want done. I also do restorations in CT.

Might work better and safer to take a nut driver socket, the smallest size that will just fit over the knurled nut, and dip that tool in the pastigrip. I hope you can scrape it off afterwards.

FWIW, I tried using good gas pliers on a knurled nut once on a Hammon Novachord. CHewed up the nut, scratched the Bakelite panel, and broke the plastic toggle off the switch handle when the pliers slipped. You really do wanna be careful out there. --Mike K.

Bob,

Well I don't think you could make it much worse short of running the RV over it. You have always wanted to do the dishwasher treatment, go for it. Then put it in the oven at 250 for a day. Take all the precautions for wash-off and meltdown. Sure a repaint may not be worth it but a little cautiosly applied sodium bisulfate will etch the chassis and the variables clean again.

This is the way I used to get them when I was a kid. They were free and I welcomed them as I couldn't afford a new one. Still have the SP-110x that was hosed off with Tough Stuff and paint thinner. Still works too.

I say use it as a learner to sharpen your skills. Suppose you got an extremly rare set in similar condition. You will gain the knowledge.

Awright, when I belonged to a Chicago SCUBA club we saw better looking stuff under Lake Michigan.

Seriously -- plastic doesn't rust. The main dial, S-meter, and bandspread plastic inserts would clean up real nice, and I'd love to have that main dial one.

Knobs also look terrific -- the skirts must be really waterproof. Wonder if their set screws are frozen, though?

You have the original tubes and transformers, though moisture may have damaged the latter. Looks like someone has replaced some small resistors underneath.

From the shiny mounting standoffs, I'd guess that you still have the metal plate over the tuners but took it off so we could see the gangs. I hope someone can clean those up.

This is a very special radio. Get it restored or part it out, but don't dump it (back?) into the lake! 73, Mike K. AA1UK

<joe.amp@NOSPAMverizon.net> writes:

>Used is fine, R-390 took a crap.

There is a mod that was published in Electric Radio a while back to use a much more common tube. Gives all of the advantages of tube rectifiers and is reversible.

The mod involves replacing the 26Z5W tubes with 12BW4 types. Both are 9 pin minis so it's just a socket-rewire thing. The heaters of the two 12BW4s are seriesed to work on the 24 volt heater supply.

The higher line-voltage concerns are justified. The mod's author reports that an R-390A had B+ of 268.5 volts with silicon, 253.7 volts with 26Z5Ws and 240 volts with 12BW4s. The manual sez 240 is the correct voltage!

See Electric Radio issue number 106, February 1998, page 15. N0YLJ is the author.

I don't use silicon rectifiers in hollow state equipment for all of the reasons mentioned (inrush, higher B+ under load, initial very high no load B+, etc.) In fact, I prefer indirectly heated rectifiers because they give a longer and more gradual startup delay.

Compare tube prices and availability, then decide.

3987. Astatic "G" stand wiring

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-10 14:20:58 UTC
From: Brian <KG4IJR@atmc.net>
Message-ID: <9sjd6k$4i6b$1@news3.infoave.net>
Source record: 47931

I recently came across a DuKane (Astatic label on the inside) copy of a DN-HZ with an unamplified G stand. The mic works (on another TUG-8 stand), the internal wiring on the G stand is great for its age, but the cord was a 2-wire job that was rotting to pieces.

The cord went in the trash. I have a coiled cord from an old Astatic hand mic (read correct numbers and colors of wires). I would like to wire it all up to a Kenwood TS-520.

The wires in the stand are as follows:

5 - yellow - switch #2
1 - black - element
2 - red - element / switch #1
3 - green - element / switch #1
4 - brown - switch #1

Does anyone have one of these wired to a Kenwood 4-pin? If so, could you help someone out and tell me which pin goes to which wire on the inside of the stand?

I can scan a copy of the schematic that's on the inside of the mic if it would make anything clearer.

Thanks!

Brian

Just taken out of service....works perfect and no hum, etc.

Comes with print-out......$75 plus shipping

3990. Re: Need 26Z5W rectifier

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-10 18:16:32 UTC
From: John Bartley <jcb@igs.net>
Message-ID: <3bed6c5b$1_1@corp.newsgroups.com>
Source record: 47934

Hello all
1) I looked at this web page with the 26Z5 specs, and if I read
right, this tube has no filaments? or did I miss something? How does a dual
diode work without a heater? I also see a centre tapped filament shown in
the diagram.
2) As far as current inrush, what happens if there is NO B+ for a
while. What I'm thinking is putting a switch in line with the B+ supply for
people who wish to make the rectifier solid state. Could thay let the fil's
warm up and then turn on the B+? It wouldn't be original, but would it hurt
anything else? It would be sort of like counting props before hitting the
mags on a P&W.

Source record: 47935

Mike:
You're correct. The radiation flux drops off as a function of the distance squared. For the most part, dose does also. I'm not sure where someone got the idea of the cubed part. Dose is a measure of the energy imparted in a unit mass of material, tissue (dose in rem or millirem) being of interest to human effects. Dose can also be measured in the air (rad or millirad), and in most cases is pretty much equivalent to rem/millirem.

Most Geiger-Mueller counters are calibrated in units of Roentgen (R) or milliRoentgen (mR, or 1/1000th of an R), which is a measure of the ionization caused in air by the radiation passing through it. As the radiation imparts energy into the air, it can ionize it, and that's what Roentgens is a measure of. By the same token, as radiation passes through other material, tissue for example, it can also result in ionization, which can sever molecules, chromosomes, etc. However, the body has a great capacity to repair such damage, and usually does. As a general rule of thumb, for radiation that's energetic enough to penetrate your layers of skin, 1 milliRoentgen (ionization in air) is about equivalent to 1 millirad (energy deposited per gram of air), which is about equivalent to 1 millirem (energy deposited per gram of tissue).

For a radiation worker, the federally-established limit is 5000 mrem/yr. However, the limit for a member of the public is 100 mrem. For what it's worth, most people receive 300-400 mrem/yr from the radiation from cosmic rays, radioactivity in the soil and building materials, the food we eat, and the air we breathe. We even get it from our own bodies... yes, we're radioactive, primarily from radioactive potassium (potassium-40), but also from radioactive carbon (carbon-14) and hydrogen (tritium) that's part of our tissues.

I've got two R-392s, and measured the radiation levels. With the Geiger probe, one R-392's meter reads about 6500 counts/min, while the other is about 8500 cpm. When I measure with an ion chamber, which more accurately measures ionization in air (Roentgens), the readings on *CONTACT* are about 1.2 and 1.8 mR/hr, respectively. At 30 cm (1 ft), the readings are essentially non-discernible from background. I should also mention that the bulk of the radition coming from the meter face is beta particles, which can be shielded out by several pages of paper. The 1.2-1.8 mR/hr readings were with an "open-window" ion chamber. When the window is 'closed', a measurement which more realistically represents dose imparted to tissue, the contact reading is about 0.2 mR/hr, or almost 1/10th of the original.

As almost everyone has stated, as long as the meters are intact, the risk is minimal. However, if the meter is opened, you run the risk of exposing the radium in the paint to the atmosphere. In and of itself, that's not that

bad, either. Radium decays largely by alpha decay, and alpha particles can be shileded out by the dead layer of skin. The great risk, though, is from inhalation. If you were to inhale some of the radium dust, it can lodge in the lung, and easily impart doses on the order of hundreds or thousands of millirem/year directly to the lung tissue. Since it has a 1600-year halflife, it's basically there 'forever', and over a liftime can impart hundreds of rem (not millirem).

Hopes this answers your questions. Bottom line it that as long as the meters are sealed, the radiation dose risk is minimal.

3992. R-392 Crystals

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-10 18:51:12 UTC
From: esejkora <esejkora@massed.net>
Message-ID: <9sjsv7$2gu$1@bob.news.rcn.net>
Source record: 47936

I've got an R-392 with a 'dead' 10 MHz band. Could someone provide a listing of which crystals provide oscillation for the mixing for the various bands? There are two banks of crystals, one bank of 5 or 6, and the other bank of 18.

Any help would be greatly appreciated. Thanks!

What I've done is take a piece of rubber (e.g. from an inner tube),
cut a small slit in the middle for the switch handle or control shaft,
slide the rubber over the control, then place whatever size socket
over the rubber that grips the whole mess well. The rubber protects
both the nut and the panel.

You can also first put a piece of paper with a correctly-sized hole
over the nut (to fit flat against the panel) to further protect the
panel from any rubbing of the rubber.

That was my first impression too. Look closely at the upper edge of the drawn envelope, you will see letter H's. I guess the lines were left out for clarity.

I like the concept of the two 12 volt tubes.

Charles.

I don't know the business arrangements Radio Shack has with their stores. I suspect they are franchises owned by local business people. These are the guys likely making the decisions to not stock small parts and hobbyist wares. Here in the northern Detroit suburbs, Radio Shacks have a good assortment of parts and are quite friendly. I usually use them as a last resort due to the lower quality and higher prices of their parts, but they are good for the occasional PC board, resistor, or switch.

Is this my old ex-buddy Colin Trass who sold me the Racal software
that didn't work and then wouldn't refund my money? If so -- spare me
== . If not, excuse me. When I first met Colin he had installed some
filters in a RA6790 which were not designed for the 6790 and BITE was
complaining. I told him how to fix that problem. That was a happy
ending, but there can be unhappy endings. Just because a receiver has
a 1.4 MHz IF does not mean these 1.4 MHz filters will work properly in
that receiver (or can be made to work properly with a reasonable
amount of effort).

This what you need??

First Xtal Osc.
Xtal Symbol Fund Freq Bands
Y401 9 0.5-1 6-7
Y402 8 1-2 5-6
Y403 10 2-3 7-8
Y404 12.6 3-4
Y405 7 4-5

2nd Xtal Osc.

Y406 12 0.5-1 1-2 9-12 21-22
Y407 15 2-3 12-13
Y408 6.2 3-4
Y409 14 4-5 11-12 25-26
Y410 8 5-6 13-14
Y411 9 6-7 15-16 24-25
Y412 10 7-8 17-18 27-28
Y413 11 8-9 19-20 30-31
Y414 13 10-11 23-24
Y415 8.5 14-15
Y416 11.333 31-32
Y417 10.667 29-30
Y418 10.333 28-29
Y419 9.667 26-27
Y420 12.5 22-23
Y421 11.5 20-21
Y422 10.5 18-19
Y423 9.5 16-17

4002. Recapping. etc. an SX-42?

Newsgroup: rec.radio.amateur.boatanchors

Source record: 47796

Say, any comments from one who's been there and done that? I have an SX-42 that works but is not at all sensitive on any bands.

How hard is it to recap and re-resistor its front end and IFs? As hard to get into as the SX-28 and the Philco double-decker home sets?

I've read thru the SX-28 restoration site (very FB!) and wonder how the 42 compares.
Thanks, Mike K. AA1UK

Well, they'll be put out of business by the competition. They still sell hi-fi stuff (all RCA, yechhh) and a computer or two (Compaq or IBM, no longer make their own), but there are other specialty stores where you can buy a bigger selection of that stuff cheaper. The only advantage of RS is that there' s one near you, closer than the big stores where you'd rather buy the stereos, phones, sat dishes, etc.

For selling hobby and repair parts, and antennas, there really isn't any competition. And they ought to know that folks come into their stores looking for small parts, and end up seeing a big-ticket stereo item that they like.

Also the place to get Sangean shortwave portables on sale. --Mike K.

Thanks everyone I received an email from someone in the next town here, he has one.
I made him an offer, Ill see what happens
I can do mods but want to keep the radio all original, (with exception of the Langford SSB AGC mod) its in nice shape.
I especially like them radium meters

I did a SX-62, which is similar, a few months ago. Mostly it is straightforward but there are a few tough ones under the bandswitch. I used the yellow caps from Bob's Antique radio. They are smaller and much easier to work under the switch wafers. There's alot of paper caps! Over forty. And I found plenty of badly drifted carbon comp resistors, too. Takes forever. It's worth it!

4014. Two coupled coils

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-11 14:06:41 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <9sm116aeo4@plutonium.btinternet.com>
Source record: 47809

New program TWOCOILS.exe

Design two single-layer solenoid coils, magnetically coupled, and position them for a required coupling coefficient and mutual inductance. Coil inductances and values of associated tuning capacitors are calculated. Program is applicable to PA tank circuits, interstage couplings, unbalanced-to-balanced impedance-matching networks, antenna tuners, etc.

Can be used for quick design of individual solenoids. Enter dimensions in mm. Results shown in inches and AWG

To complete the picture the guts of this program need to be built into particular application programs. I'm thinking about it.

Download TWOCOILS, one file, 38 kbytes, in a few seconds from website below.

It is definitely easier than the SX-28. No need to disassemble other components to reach the capacitors. It's vital to replace the paper capacitors to avoid burning out your bandswitch.

Does anyone have any tips on replacing the two paper capacitors tucked
under the bandswitch and trimmers of an SX-23?

What was Hallicrafters thinking when they put those capacitors there
(for that matter when the built the entire receiver)!

Norman

Would someone have a copy of the original manual for this AM transmitter as I have recently acquired one in rather a sad shape.

In fact is there someone based here in the UK who would be up for a refurbishment commission.

I normally prefer low voltage/high current, not the other way around and am somewhat reluctant to get too involved in this beast.

I do however have a soft spot for A trying AM again.

4029. FS: 45 foot 'one-man' military TOWER

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-11 20:20:10 UTC
From: WA2BAH@webtv.net
Message-ID: <19568-3BEEDD7A-438@storefull-125.iap.bryant.webtv.net>
Source record: 47823

I have a 45 foot "one-man" military type tower available for picking up
in the Albany, New York area. The price is $150

LIST OF ITEMS FOR SALE: (revised 11/6/01)

http://sdstudio.freeyellow.com/page3.html

4030. WTBWTT: ART-13/ATC Knob, etc.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-11 21:35:20 UTC
From: "D. S. Platt" <jeepp@erols.com>
Message-ID: <3BEEEF18.481AF97E@erols.com>
Source record: 47824

I need a replacement "B" knob for my ART-13. The outer ring on mine has part of it cracked off. I don't need the locking bar, etc, .. just the knob part itself. I'd also like to find another front panel assy. that goes in the space for the LF unit. I'd like to modify the one I have to accommodate the additional loading variable cap, but also to have an original so I can restore it, if necessary.

I have extra large knobs for all other tuning functions, so if anyone wants to trade knobs..... I also have a motor and some of the autotune mech assemblies, and some spare good 813's, again for trade.. only. Thanks for the read.

Source record: 47828

I have a nice Kepco Labs (known as Kepco Power these days, url is: http://www.kepcopower.com/navprod.htm) in good shape and fully functional. Has a nice tube compliment inside: 5881 x4, 5U4GB x2, 6GW6GT x1, 6U8 x2, 12AX7 x2, and 5651 x2. Also some nice cans , 4mfd 1000V x2, 8mfd 1000v x2, and three transformers. Don't know much about the transformers other than the part numbers on top which are 100-668, 100-664, and 100-662. This is a clean attractive unit. Measured output at 425V. Capable of 150 mils. I don't have a manual but the url above might be able to send you info on it through email.

Will sell for $150.00 + shipping. Estimate 50 lbs or so..

Dave K5FNG k5fng@arrl.net

I asked that question many times when recapping my SX-28. All I could come up with is that the designers figured those components would rarely, if ever, need replacement during the expected lifespan of the radio. I bet they never dreamed that people would be resurrecting these things and doing wholesale restorations sixty or more years in the future. Kinda like the COBOL programmers who never dreamed that people would still be using their crusty old software in the far-distant year 2000 (and thus didn't take Y2K into account).

Phil

4040. Kenwood TS-940 SAT Problem

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-12 01:53:51 UTC
From: Phil Beautrow <kg6kb@gte.net>
Message-ID: <PYFH7.35$b72.10013@paloalto-snr1.gtei.net>
Source record: 47834

I would appreciate advice from any of you experienced TS-940SAT operators. I am transmitting CW and all of a sudden the power drops off, there is a chattering sound from the ant. tuner area and the smell of burning electronics somewhere.
I have a 940 repair and adjustment video that I reviewed. The tech. describes common problems with the Tuner, AVR and PA units. The radio lights up and the receiver works. The tuner appears to be working, but not tuning anything. I pull off the red lead from the AVR to the PA and read 30 volts so I assume the problem is with the PA and the power supply is OK. I turn the radio off, and using an ohmmeter read zero ohms to ground at the red lead using the positive ohmmeter lead and 150 ohms after reversing them. The video says the reading should be about 150 and 2,000 ohms respectively. So instead of a "shorted" PA it appears to be "open." I clip the zener diode, D-1 on the PA board as suggested and check the readings again which do not change, so it is not this component which is supposed to act like a fuse. Apparently, either the driver or final transistors or something else has failed on the PA board.
Any suggestions as to further trouble shooting? Also, where I might get the rig serviced by a knowledgeable Kenwood shop?
Thanks,
Phil, KG6KB

no, if you are reading zero instead of 150, and 150 instead of 2000, your
problem is not an 'open', but a short.

not being familiar with that unit, I don't know what's on the other end of
that red lead, but I DO know that you have something shorted, not something
open.

That's reassuring, but I'm pretty sure that the R-392 (not the 390s) also has
radium paint in the pointer notches in the knobs. I remember going into my
back basement for something one night after I'd been in bed, so my eyes were
dark adapted, and I could see all the knobs just barely glowing.

If any of that paint wears off on your fingers from your own "radio activity"
then you might have a problem. Not that I worry about it, but thought it
should be pointed out.

Walt -

Thanks for the comments. The UK audio designer gave me an idea to look at a toroidal transformer, as a possible isolation transformer under the S-38 chassis.

I received and e-mail for Brian Gladstone, Director of Engineering at Plitron Corporation in Canada
http://www.plitron.com

Plitron makes Toroidal transformers, and by my measurements one of their 50 VA units will slip right
in under the S-38 chassis. You can mount it with one screw (use the hole for the old multi-section electrolytic)
As well as select from a few secondary voltages (110, 117 vac)

Presto, same $ 35.00 USD price (thanks to CDN / USD exchange rates) as a separate Stancor P6410 (50 VA rating), without hauling around an external unit. Change AC cord to a polarized plug & fuse, a MUCH safer chassis around children. A power switch could even be mounted on the back chassis (or rework the receive/standby switch on front panel).

I e-mailed to Bob Eslinger, KR1U and he would be interested in hearing from other restorers using this approach
Might be a solution for some of his restoration clients as well. So far, I'm still napkin drawing.

Message-ID: <3BEF72A9.C866C7C6@earthlink.net>
Source record: 47744

The shift took place there a *long* time ago ("Radio Shack: You've got questions, we've got blank stares"; let me tell you the one about the clerk who I asked for LEDs, and he calls his super on the intercom and, reading out of the catalog, asks: "where can I find the light emitting deities?") . . .

As for something better, try: Mouser, Digi-Key, Newark, Allied, Ocean State, Antique Elec. Supply, Surplus Sales, Fair Radio, A.G. Tannenbaum, Dan's Small Parts, RF Parts, All Electronics, Ten Tec, and Ramsey. If you have to shop on-line/mail order, might as well have better quality parts at better prices. Alas, gone are the days when we could browse the aisles of a parts store (unless you are lucky enough to have a good local owner-op supplier).

4053. FS.R109 Communication Receiver,Vintage Brit Military Set.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-12 10:16:39 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <tuv84cffs9uqb1@corp.supernews.com>
Source record: 47747

FOR SALE Vintage R109 British Military Communications Receiver

The R109 Military Communications receiver,dates from the 1950's.It is a well designed,compact equipment,made in relatively small numbers for use by the British Army.R109 Communication Receivers are quite scarce and are a receiver which at radio-exports.com ,in the UK,we do not see very often. Frequency coverage of the receiver is 2Mc's to 12Mc's. The receiver uses 8 tubes.The R109 which we have on offer is a particularly nice example.Quite remarkably,it still has the internal pull out spares tray,(which is usually missing),together with the original set of spare valves and a spare vibrator).Externally,the receiver is in good condition and internally it is in near mint condition.
This receiver is in good working order and is an ideal example for the collector of vintage military sets.
The price,which INCLUDES the cost of Packing and of Air Freight to the USA, is a very modest $328 US Dollars,which as you will readily appreciate,makes this scarce set particularly good value for money.
If you would like more information or wish to order this receiver,please contact Graham Leo info@radio-exports.com

Thank you for your interest.

Speaking of RAO-7's, that plug is not that uncommon. You might find one even at you local home supply store. I know I needed one for mine, but it has been many years, and I don't remember where I picked it up now. Look around, and maybe someone else can give you better information than me.

What I need is the front panel for an RAO-7. That is all I need to restore mine completly. If anyone has a junker RAO-7, they might get ahold of me.

> Does anyone have any tips on replacing the two paper capacitors tucked
> under the bandswitch and trimmers of an SX-23?

May not be comforting, but many rotary sw's & front panel controls are wired tightly in this manner, and one must generally free & back the switch from the panel, carfully making way to do so without damaging adjacent components - and/or do more mechanical disassembly. It is also not uncommon to break a rotary gang, and by the '50's replacement gang wafers were easily available. Some switches are so tightly wired that it is faster and easier to replace the whole wafer circuit when one has them. In any case, good desoldering skills/tools & no overheating - especially when a number of delicate other components must be removed for clearance - is the order of the day.

> What was Hallicrafters thinking when they put those capacitors there
> (for that matter when the built the entire receiver)!

Most likely, good RF construction practices - like lead & component dress, and/or convenient subassembly strategy that worked well in terms of mass production. For example, it is easier and sensible to instruct one person to only solder components into a ganged switch ass'y, that may then be installed with only 3 or 4 connections further down the line.

I think if anyone knew then how bad paper caps really are, they'd have put them all outside the cabinets. :-)

Dos anyone know any of the fllwg ree this canoe anchor?:

- band range (dial is 20-40 but I doubt it's near-DC<G>);
- schematic somewhere?
- supply voltages? (has 5x 1.4v toobs, never saw a plane w/7 volt battery);
- female Amphenol 4-pin slip-in cnctr, approx 5/8" dia, to mate? Or pinout (can probably figure that out)?
- an antenna cnctr that must look just like a bayonette=based pilot bulb? Sucker has 2 such sockets (ANT & LOOP), no room to convert socket.

Asking these dumb Q's because it's a tight little sucker to trace out & I want to get it running. If it's 2-4MC it'll work 80M AM QRP with a little AVT-112<hee-hee>.

Also have an AVT-112 (WW2 light aircraft xmttr, & it's AVA-126A supply to sell, for party restoring old aircraft or wanting to play with it. 6/12/24v, xmttr is 6 lbs, 2500-6300, cute little thing, panel very nice, rated 6-7W out AM.

4072. WTB Transmitter for 400-500 kHz band

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-12 23:08:58 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <9spkqajnn1@news.hawaii.edu>

> I think if anyone knew then how bad paper caps really are, they'd have
> put them all outside the cabinets. :-)

Or manufactured them with pins and sockets, like tubes! It is just not human nature to think ahead decades into the future and imagine whether your short-term-reliable components/media will hold up several decades later, long after most of those sets finished their natural lifespan and were discarded.

Look at old movie film, audio tape, magnetic computer disks. Decades later, we know that those things degrade, but at the time, preserving for future ages was not a priority -- or for consumer devices, an economic practicality. A 1950s mil-spec radio, with ceramic coil forms and switch wafers, gear-driven tuner, oil-filled capacitors in place of paper, etc., will hold up pretty well today with minimal restoration. But most everyday consumers would not have paid extra for such construction quality at the time. And that thinking persists. When I bought a CD burner last year, I didn't consider whether it would last long enough for my grandchildren to use it.

Phil

| The shift took place there a *long* time ago ("Radio Shack: You've got
questions,
| we've got blank stares"; let me tell you the one about the clerk who I
asked for
| LEDs, and he calls his super on the intercom and, reading out of the
catalog,
| asks: "where can I find the light emitting deities?") . . .
|
| As for something better, try: Mouser, Digi-Key, Newark, Allied, Ocean
State,
| Antique Elec. Supply, Surplus Sales, Fair Radio, A.G. Tannenbaum, Dan's
Small
| Parts, RF Parts, All Electronics, Ten Tec, and Ramsey.

Hey, are you looking over my shoulder.

It's a good list. Mouser is the best.

I live within walking distance to RS. I'd rather walk to Little America.

>If you have to shop
| on-line/mail order, might as well have better quality parts at better
prices.
| Alas, gone are the days when we could browse the aisles of a parts store
(unless
| you are lucky enough to have a good local owner-op supplier).

We have Jack Arbuckel's, but he's way too expensive. He'd have the 11V
zener in a pinch, and on Saturdays. But you'll pay $3 each.

'Nuff said.

4077. Re: Baby BA Info WTD - AVR-101A

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-13 02:12:09 UTC
From: David Stinson <arc5@ix.netcom.com>
Message-ID: <3BF08179.D51DD974@ix.netcom.com>
Source record: 47768

lbrty4us@aol.com wrote:
>
> Does anyone know any of the fllwg ree this canoe anchor?:
>

The RCA AVR-101A is a WW-II era commercial Beacon Band (195-405 KC)
Aviation Radio Range receiver designed for use in light aircraft.
It was accepted for use by the Army Air Corps in WW-II and spare
parts for it appear in the Signal Corps SIG 5 catalog for 1945.
It served as a "ferry" receiver for aircraft being flown
from the factory to military bases and points of embarkation
(the final radio installations were done in theater,
since equipment type depended on equipment currently available
to the unit receiving the aircraft).

After the aircraft was delivered, the small radio range receivers
(usually, but not always run on dry batteries) were removed
and the ferry pilot carried them to her/his next assignment.
One or two aircraft in a ferry flight
would also be equipped with a transmitter, usually tuned to 3105 KC.
The matching transmitters for the AVR-101 are
the AVT-110 (dry batteries) or the AVT-111 (6/12 volt vibrapack).
Both were fixed crystal control on 3105 KC.
A switch allowed operation on 6210 KC by doubling in the final.

The AVR-101A IF frequency is 490 KC (up conversion).
It does not have a BFO.
Output impedance is 600 ohms and is designed to feed two
pairs of headphones (pilot/copilot). Output power 50-100mw.
Voltages 1.5v A, 7.5v C, and 67v B.
With the exception of the "C" battery, voltages can be
supplied from the matching transmitter supply.

Tube compliment:
1R5 converter
1T4 1st IF
1T4 2nd IF
1S5 detector / 1st audio
1S4 audio output.

Assuming the battery cable is present and original,
the connections are:

Red 67.5v B+
Green 7.5v C-
Brown 1.5v A+

Black Ground,A-,B-,C+

Expect 90% failure rate of the wax caps.
About 25% of resistors will be out of tolerance.

The antenna connector near the top is for a wire antenna.
The one near the bottom is for a loop.

I have used RCA AVT/AVR equipment on the air with success.

P.S. If anyone has an AVR-100 or 101 they wish to sell
or are parting out, my 100 needs a case.

Regards,
Dave S.

Just got an old 'unused' mini stereo amp from Radio Shacks' biggest
competitor (once upon a time!)
A Lafayette Stereo 10A.
Tiny little thing makes a great computer amp.
It had a slight hum in it.
The 1000uF cap was sitting there on Rat Shacks peg board.
Couldn't believe it.... SAME BRAND (nichicon)
Of course the new 35 volt one is smaller than the original 25 volt one!
Nice to be able to 'stop by' and grab it!

Source record: 47777

Hi,

3 pcs EF 14 Telefunken, NOS for sale. This valve is equivalent to the extremely scarce and expensive VF 14 EXCEPT for the heater voltage. EF 14 needs 6.3V, but the VF 14 needs 60V (Some Neumann mics run the valve on about 30V) The only thing you have to do is to alter the heater circuit in the powersupply of the microphone.
You can find a picture of the valves at my web site: www.demostenes.no
Just search for EF 14.
The VF 14 is extremely expensive, $ 750 - $ 1750 a piece. The EF 14 is much cheaper - only NOK 929.- each or about US$ 104.- + shipping.

Best regards,

Arnold Goks&#65533;yr
DEMOSTENES - N6899 Balestrand, Norway

4091. FS: HF military receiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-13 15:07:49 UTC
From: gspubl@tca.net
Message-ID: <3bf13725.1302001178@news.tamu.edu>
Source record: 47781

I have a BC-342 HF receiver that has a very nice front panel on it. It appears complete and unmodified. I can provide a manual copy for it.
$115.

4092. TS-35/AP manual?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-13 15:31:56 UTC
From: Marty Reynolds <marty@ba-watch.org>
Message-ID: <M1bI7.738$jp.94602@bin2.nnrp.aus1.giganews.com>
Source record: 47780

I'd like to copy one. Anyone have a copy?

My TS-35/AP (s.n. 5) runs OK but some switches still a mystery.

Tnx,

Marty AA4RM

(TS-35 is X-band sig-gen & RX)

4093. Series / Cathode Modulation?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-13 16:13:32 UTC
From: Tighe Smalley <tsmalley@twcny.rr.com>
Message-ID: <MEbI7.146333$Ne.10989575@typhoon.nyroc.rr.com>
Source record: 47783

Are these the same thing? If not, how do these two approaches differ?

E.g., on the "AM Window" webpage there is a QRP tx design shown, a 6AQ5 modulated by a pair of the same. No modulation transformer is required -- the output of the modulator is connected in series w/ the cathode of the RF amp.

"Cathode modulation" schemes I have referenced in the handbooks _do_ use a transformer between the af and rf stages. So why is the 6AQ5 rig different?

Thanks for any clarification/info.

Have a new batch of this excellent handbook. Its the latest 23rd edition, the hardbound bible of builders and superb classic reference for all areas of interest to hams.

Bill/W6SAI lives on via his many gifts of articles and books. His writing methods allow all levels of technical backgrounds to understand and learn from his expertise.

The Handbook normally sells for $52.95. We're selling them for $39.95 plus a flat $5 shipping within the US 48. You can order online or call, fax, email. Follow this link for more information: http://www.websitea.com/mai/Books/books.htm

Now is a good time to get a friend a copy for Christmas as well as one for your library.

4097. Re: HQ-145A vs. HQ-160 or HQ-150

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-13 17:31:25 UTC
From: TCNET058@ysub.ysu.edu
Message-ID: <525B020S86.TCNET058@ysub.ysu.edu>
Source record: 47786

Interesting comments about the HQ-145. My brother has one and its
in like new condition. He bought it back in 1972. It was where I
first heard 10 AM signals. I can say that for AM pickup it has a
very nice sound to it. For anything else, there is no product detector
in it so you have to do the old shut-the-avc-off and fiddle with the
rf gain when you turn the BFO on. In short, it stinks. Freind of mine
bought a HQ-180 and there was a real improvement in SSB/CW reception,
but then the 180 had the product detector.

So if all you are going to use the 145 for is AM you are fine. Its
not too bad at all and sounds good. My brother still has his and in
fact, its sitting in my basement and I am tempted to use it for 80m
AM.

I have a great project for you. How about a Galaxy III hf transceiver with power supply in the optional speaker cabinet? Picked this up at an auction for a winter project, but have run into a time crunch. The thing works....sort of. Everything lights up and transmitter will tune. Receive is weak and transmit audio is almost non-existent. The diagnosis around here is that most of the resistors in the circuit have changed value over the years and many of the caps are probably also bad. The face plate is in good shape and the cabinet is in fairly good shape but would need repainting to return it to "collector" condition. The power supply/speaker cabinet looks like it has been dropped. A little out of square, but should be able to bend it back with little problem. The power supply works fine, but I would be a little wary of the filter caps due to the age. The speaker itself works, but I would replace that too. Comes with a hand microphone and the operating manual. Asking $75 plus shipping. Of course you are welcome to pick it up here in Lincoln, NE and save the shipping charges. (It is somewhat heavy like most boatanchors, and would have to go in two boxes.)

Let me know if interested.

Source record: 47694

Good point, Mike. I thought of that, too, and all of the knobs I checked (on both receivers) came up "clean" (no detectable radioactivity). Undoubtedly, no radium paint. I suppose it's possible the paint could have had tritium (radioactive hydrogen) mixed in. While still radioactive, the tritium has such a very weak beta particle that it can't be measured with a 'standard' geiger counter.

I suspect the knobs were painted with the run-of-the-mill zinc sulfide paint that would get "recharged" by shining a bright light on it, and not shine 'automatically' from the radioactive decay. And for whatever it's worth, fluorescent lights are much better for 'juicing' up the paint, than are incandescent. That's due to the higher component of ultraviolet in fluorescent bulbs, which is largely absent in incandescent. Take a black light to the R-392 knobs and they shine like beacons. Still no radioactivity, though.

Ken Sejkor - WB0OCV

Good question!

I serviced remote battery operated seismographs for a short time during the late 1970s. Since time to the nearest 1/10th second or better is critical to interpretation of data from a seismograph, the seismographs were equipped with WWV receivers for time control! Every second (except on the half minute) a blip was plotted from the "tick" of the WWV signal. We didn't "catch" any significant activity during the deployment but two weeks after the monitoring program terminated due to funding problems, a swarm of small earthquakes occurred at the base of a nearby volcano!

OK, thanks. Of course we all know that kind of paint from modern clocks and watches.

However, ISTR that when I saw these knobs glowing, it was a few hours after the lights had been on in that room, and the glow had that scinallating quality of real radium. Now I'll just have to go look closely this time -- see if I can find the R-392 without turning on the lights :-) --Mike K.

Heathkit made one like you describe years ago, but they are no longer in business.I don't know a model number, but you might be able to find one at a hamfest or Ebay.

Jason

Could that be new stuff ?
Test results show its 10X brighter and visible for 20 hrs, this stuff looks
great but haven't tried it yet
The particle would have to be small 5-15 UM to silkscreen or fill a R-390
panel
Check out
http://www.blacklite.com/Products/Super_Phosphorescent_Products.htm
Hmmmm
My R-390 meters are still on automatic :) :)

There is a problem with the atomic clocks. I have two of them and have one set for local time and the other set to read out in 24 hour format. But what I really wanted was to be able to set the clock to Zulu or GMT and you can't do that because it will reset to one of the USA time zones only (setable). If you set it to Zulu time, it resets itself back to local time....

That is because they are not 'ham accessory' clocks.

AHHH, errr, READ THE ORIGINAL POST....

He is looking for LED readout, not the LCD readouts. He'd like it to be AC powered.

I must admit that the "atomic" clock I have with LCD readout is hard to read and every single "atomic" clock that I've seen advertised or on the shelf is BATTERY powered.

If you have a permanent internet connection, e.g. xDSL or a cable modem,
you can use a program called NTPD to keep your clock in sync with WWV.

Apparently so...and it applies to watches, too.

My current Timex Expedition is a good example, you can get it (or at least could when I bought mine) with a digital compass *or* dual time zones. Apparently Timex figured that a lot of people would want one or the other, but that nobody would ever want both. Really sucks for astronomy or ham, where both can be quite useful, and having them backlit on a watch is a real bonus.

I have a pair of MFJ big face 24 hr analog wall clocks. One
for Zulu and one for Local time. They run on one AA cell for
years and keep surprisingly good accuracy. They stay close
to the minute with yearly corrections. I removed the sweep second hands though, because
they were so noisy they kept
me up at night.

The computer is another story. It loses time in a matter of
days. There is a program called Dimension 4 that automatically
updates your system clock when you go online.

Source record: 47736

Way back in the old days... Well, in the early 70's, I did a short stint working for a TV repair service. In the parlance of the day I was the "tube jerker". I'd go on the service calls and look for blown tubes or fuses in TVs and if I couldn't fix it in-house I'd drag it back to the REAL techs in the shop.

That was about the time Motorola was producing the Quasar and TVs were just beginning to use solid state devices. I remember the shop techs experimenting with building "replacements' for tubes with stuff off the shelves. If memory serves, the only real problem they had was damping the voltages so the smoke didn't escape from the transistors.

Has anyone looked into such an arrangement to replace those now nearly impossible-to-find tubes?

Lessee - 100 V @ 1 W = 10 mA

If it doesn't have to be exactly 100 volts, you could use a 0C3
(octal, 105 volts) or 0B2 (7 pin miniature, 108 volts).

I had a fellow ham pick me up a nice atomic clock from Sam's Club a few months ago, and send it to me.. even though I didn't have access at the time to WWVB, and knew it would be unable to set itself. However, since that time, JJY has added a 60KHz BCD time and frequency service, and now my clock sets itself several times every morning on the hour. :) I like the clock even better than I did when I got it, now that it does it's job.. :) Even has an indoor/outdoor thermometer on it.

The 1N4764 seems to be dropped from the listing in my ON SEMI data book and it stops at 1N4763 (91 V).
I don't have any but if I did you would be welcome to them.
Couple of suggestions though;
1) NTE lists their NTE 5096A as a replacement.

2) Two 1N5262B in series.
The 1N5262B is a 51 V, 500 mW and has the same Izt as the 1N4764.

Maybe either of these are available to you.
Good Luck,
Gary.

Hello all people. I have an academical project idea. I have a Kenwood TS50 (not TS50S). I woule like to make an application to control my TS50. In my TS50 manual appears little info about the unit IF-10D (with a 6-pin connector). I have no idea how could later I connect the IF-10D to the computer. I think that I should connect to a RS-232 computer port, and perhaps also I need the IF-232...
Also I would like to connect my TS50 to a computer running a server (eg. in Linux OS), and a RealAudio server to broadcast to Internet "real time audio" from the TS50. Then I would like also to develope a Java "applet" to put on a web page on Internet, with the appearance of the TS50 front-end.Then the user should be able to change freq., mode (am/fm/usb/lsb/cw),memories,etc...And of course the operation should be taken on the TS50.
I have a lot of questions:
- What I need to connect the TS50 to a PC? I think IF-10D, but...anything more?
- Once I have connected the TS50 to the PC, I think I could send data from the serial port of the PC to the TS50, but...what data must I send to perform each of the different controls? I think there should be any reference from Kenwood...Any info about this?

Running Time Meter, Measures Hours - Ebay

This running time meter reads in hours and tenths of hours. Timer scale is 10,000 hours, and currently reads 0.2 hours. This meter runs on 115 volts. It was made by Industrial Timer, Model C-25, and it is still in production. If interested, I'll send you the manufacturer's PDF file that describes the meter's specifications. It is in very good condition.

For auction on Ebay, click on:

I would imagine that LED clocks that work on AC would be more expensive to make than LCD ones these days. You've got a transformer to provide, decent power supply, the expense of UL listing, etc.
Might also be a problem with power line noise coming in and wiping out the WWVB signal; I'm amazed that the LCD ones can pick it up at all, even mounted anywhere near AC powered equipment.

You can still get LED clocks for $10 or so at the local drug store, but I've never seen an "atomic" one.

I like the LCD ones. I have an atomic one with a huge display that's solar powered. I just hung it on the wall and never touched it again!

Hi
The grid wires are most likely rotten anyway,
why not just replace them with longer
wires. It is a little harder to get the
lead attached inside the tube shield but
long nosed pliers will do it or get shorter
shields.
That is the only difference I know of.

Recently, a radio friend sent me a scan of a QSL card that he received from the 1954 Hallicrafters Clipperton Island "DXpedition." A big image is at http://antiqueradio.org/art/halli0919.jpg .

You can read a little more about this radio expedition at http://antiqueradio.org/halli09.htm . The purpose was to promote Hallicrafters receivers and transmitters, as in the expedition to the Mountains of the Moon, etc. An interesting piece of radio history.

Thanks, Ed!

The Heath clock is model GC-1000. Mine has been inop. for years because
I dropped the receiver board and ripped off three cans. I missed that
reliable old clock so much that I designed one of my own around a
Motorola MC68705 microcontroller. Lightning strike took out the
receiver. Now I have three commercial "atomic" clocks that have LCD
displays. Can't read them from across the room!

-Hello all people. I have an academical project idea. I have a Kenwood
-TS50 (not TS50S). I woule like to make an application to control my
-TS50. In my TS50 manual appears little info about the unit IF-10D (with
-a 6-pin connector). I have no idea how could later I connect the IF-10D
-to the computer. I think that I should connect to a RS-232 computer
-port, and perhaps also I need the IF-232...

Yep, the IF-10D (which is just a box containing a 7404 hex inverter and some pullups) connects to an IF-232C which has a 25 pin serial connector for the PC. There are plans for the IF232C in the ARRL handbook - I just opened one and it looks like standard old 1488/1489 drivers with an opto and a 555, probably to generate -12V. I'd use a MAX-232 these days.

The data format is included in the IF-10D manual.

While I haven't bought one to check it out, for about $12 Canadian, I've seen LCD clocks, with calendars, that by a press of a button, gives you the time in a number of time zones around the world. I forget how large the readout is (and I am assuming they give readout in 24hour time), but it's small enough (and cordless enough) that one can place it in easy range.

It doesn't give 24hour time, but I got for about five dollars a nice LCD clock, battery operated, The digits are 3/4" high and quite readable. When the original battery died, I soldered in an external single-AA battery holder, and methinks the battery will last practically forever.

Your point about LED clocks still being available is good. Even if you couldn't buy them new, there must be plenty at garage sales and places like the Salvation Army. Most of them, however, don't give 24hour readout. On the other hand, a lot of them must use ICs that can be set to that format. Especially with older clocks, where the IC will be well defined (as opposed to a blob of epoxy with leads coming out of it), one might be able to find the data sheet, and then set the jumper(s) for 24hour readout.

As for long term accuracy, I think what we are seeing is a move away from line-based counting, which overall tended to stay within reason, to crystal based timebases, where the errors just add up. With these clocks costing so little, there won't be much effort put in setting the time base accurately in the first place. Indeed,

some cheap LCD clocks/watches I've seen don't even have a trimmer
for adjusting the crystal frequency. So, oddly, those clocks that
reset to WWVB may not be due to a need for "super-accuracy" but to
compensate for cheap clocks. In effect, they are a modern day
way to return to the days when clocks got their timing from the
AC line; they might speed up at times, but then they'd slow down
at other times, and thus rarely ran slow or fast over the long term.

So the solution might be to buy an LED clock at a garage sale,
set the jumpers, and then run it off a homebrew crystal time base,
one that could be set accurately to WWV. Use the same time base
as a frequency standard.

Just like in the old days.

4183. Swan HF-700S Transceiver FS or For Trade

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-15 18:18:51 UTC
From: Bruce Stock <stockb@accessone.com>
Message-ID: <fGTI7.26232$ck.296332@sjc-read.news.verio.net>
Source record: 47672

This Swan HF-700s transceiver with PSU-3 supply has been benchchecked and used on the air with good signal and audio reports. It is in very good cosmetic condition with only minor blemishes on the casework. It comes with the original factory manual.

Pictures are available at:

HF-700s http://myweb.accessone.com/~stockb/misc/pb140002.jpg
PSU-3 http://myweb.accessone.com/~stockb/misc/pb140001.jpg

The factory specs are 550 W pep input on SSB and 350 W input on CW, so this rig is sort of like having a small linear built in. Measured output is 250w CW on 80m. This unit does not contain any options, such as VOX or the 16-pole filter.

Any other details, info or pictures will be gladly provided to serious interested parties.

Price is $330 plus actual packing and shipping costs from Seattle.

Alternatively, I will consider working out a trade involving any of the following equipment: Hammarlund SP-600, RME 4350 or 6900, National NC-183D, Gonset G-66 and G-77.

73, Bruce AB7YD

In defense of W7FG manuals, I have to say I've bought several from them, and they do an outstanding job. The manuals are bound with covers, and are very clear. They include two copies of the schematic, I suppose in case you want to make notes on one.

It is true that often someone in this group has the schematic or information that someone is looking for, and will freely make it available. (I frequently do this.) I don't find it out of line though for a commercial schematic company to respond to a request for a schematic. The person looking can always decide whether they want to pay the price for the information they need, or wait and hope someone will offer it free. In any case, I am glad the commercial schematic vendors are there when you need them.

For sale: This is the general coverage version of another ham band only receiver. This radio covers broadcast band through 33.5 Mhz in 4 bands. It has a main tuning dial and a band spread dial. The radio is electrically very good, and all functions work. It has 7 tubes. Physically there are no dents, but there are scratches on the top of the case and on the bottom lip of the case below the knobs (in the light gray areas). The front of the radio (dark gray area) has no scratches, and the dial glass is in excellent condition with no cracks. You will note in the picture below a close up of a 3/8 inch hole that has been drilled in the rear left corner of the top of the case. Why is the hole there? There is an adjustment screw below the hole on top of the chassis.
$75 plus Exact Shipping.

That's great news, Brenda! Glad it worked out as well as it did. Mine only sets itself at around 1AM, and it often misses a couple of days a month.

By the way, Sam's Club has some other models now, indoor temp only, but it does have a "moon phase" indicator. Since the time code doesn't include moon info, my guess is that you have to set that feature manually and then it tracks the moon's 28+ day orbital period.

Bob M. WA1MIK : the fellow ham who bought it for you !

Slowly, I am assembling the complete set of accessories for my Millen 90651 GDO. Now I am especially looking for the 90751 Tone Modulator. Small 1-5/16" square box 2-3/4" tall with a 1/4" phone plug sticking out of one end.

Two other items on my want list are the Millen Balun #46672, and the 90671 SWR bridge. Any and all leads appreciated.

From: Phil Nelson <philnelson@antiqueradio.org>
Message-ID: <LI0J7.92529$aW5.1194701@dfw-read.news.verio.net>
Source record: 47607

Pardon if this is a time-worn topic, but does anyone have any wisdom on the topic of building or kludging a digital frequency display to show what your favorite boatanchor is *really* tuned to?

I did a web search and found a cheesy LCD-display product that is not what I'm looking for. For what it's worth, I also have a BK Precision 1801 freq counter that I use about twice a year and would gladly devote to more frequent service toward this goal.

Thanks for any tips, theory, etc. I would like to use this sort of thing with 1940s - 1960s Hallicrafters & Hammarlund gear.

Phil

Best advice yet! By coincidence, this week I got a book from the library about restoring old cameras and it has lots of similar advice about using improvised "rubber tools" to remove stuck cylindrical rings, collars, round buttons and whatnot from cameras. Besides a slit flap of inner tube, you can look for a slice of rubber hose, O-ring, furniture cup, etc., that happens to fit whatever you're trying to loosen. The book also had other tips about fashioning homemade tools, lubrication, etc., which would apply equally to fixing boatanchors. I can testify that the inner tube trick works! There are probably other books like it, but this one happened to be "Restoring the Great Collectible Cameras" by Thomas Tomosy (in 2 vols.), published by Amherst Media.

Back in the BA days, a manual usually was included in the sales price of a piece of good commercial test equipment. So the typical signal generator might have cost $1,800, and the manual was, in effect, free. So now that that same generator can be bought surplus for $40, I suppose you think that manual still ought to be free. When the manuals got to be 100+ pages, with fold-out B or C size schematic pages, the sales price of a generator might have gone to $4,000, and the manual was a $25 option. So now, that gear, surplus, might cost $75. And at the 160:1 ratio, maybe you now think somebody should sell that manual for 16 cents?

Now let's get personal. You say you have some manuals? Let's assume they are originals, maybe plastic GBC-bound spines with say, 100 pages. And five of those pages are fold-out schematics. For you to give someone a copy, you have to make a copy. That means unbinding the original, standing at a photocopier feeding the sheets by hand (what if you used the autofeeder and it ate a few of those master pages?!!), rebinding your original, getting a big envelope, affixing an address and maybe $2 for media mail postage, and your time for mailing it. I think that you'll put in about 2 hours on that job. What do you get per hour at your day job? Would you work for $5/hour? If you would, you would need to charge about $13 just to break even (and that's assuming you stole the copies from your day employer, or were you going to pay 5 cents per page for the copies).

And how did you handle those oversize pages. Multiple copies, and then cut and paste the copies into a single sheet? Or just photo-reduce them to an unreadably small size? And don't forget the wear inflicted on your originals, and the probability that somehow, you'll lose a

piece of the master document somewhere in this process.

I think that $20 is pretty darn fair for a copy of a typical manual. If you can't get the BA to work without a manual, then what's the BA really worth? You have to view the manual as current information, not as 40 year-old paper. I noticed that a guy on eBay was auctioning CD's with the manuals for about 40 Tek instruments. IIRC, the CD's were going for about $25. Not a bad profit, considering the cost of burning a CDR is small. But remember, first, he had to have those manuals. Then, he had to scan them in, organize them into a package, and store them for whenever he burns the CD's. So even at $25 per CDR, I don't think the guy is getting rich.

I have sold manuals (usually for around $20), and I have also given some for free. And a few times, somebody has been so surprised to get a free manual that they have sent me more than $20 as kind of a gift for a gift. But then I'm not trying to make manuals a paying business. Manuals are just part of the hobby. When I buy a BA, I expect FedEx to charge me the going rate for shipping. If I need a manual to fix a BA, I try to find a free dl site. But then I check the dealers and I either buy it or pass the BA on to somebody else who thinks they can fix it without the manual.

To me, BA's are a hobby, a recreation. When that's the case, you don't expect to turn a profit, or even break even. You wouldn't expect to make a profit by going fishing.

Ed

Wrong!
In 1961 the average wage was $1.96 per hour which means 455.5
hours of labor to pay for the rig. The average hourly wage now is over
$14 per hour. If you worked the same hours to pay for it the price
would be $6370, so $3875 is a bargain!
If you look on the SSA.gov site and get the average hourly
wage rate for the last 40 years then convert prices to hours of labor
at the time, it's a real eye opener.

Look around for a sound distribution transformer...might also be called a 70 volt distribution transformer. Hook the primary (high impedance side) up to the 500 Ohm output, the secondary (low impedance side) connects to the speaker.

==========
A filament transformer with a 120 VAC primary and 12.6-volt secondary
will match a 500-ohm output an 8-ohm speaker.

Phil

I bought a radio Adventures digital Dial Kit for my Drake a year or two ago. After a little troubleshooting, I got it working and it is neat. You can check it out at the website at http://www.radioadv.com/products/FreqMC/A2.htm

If you are not into kit building, [this one has a lot of small parts work] they sell it assembled too. Also, it has memories for storing different offsets for different pieces of gear or if one band tunes backwards lilke on the Drake TR4's. . On the Drake twins it simply plugs into the injection jack in the back, and it works and looks very nice.

Well, let me tell you an old timer's approach with a modern twist.
With the plethora of different conversion schemes and if/oscillator
combos in the average old tyme boatanchor receiver, trying to use
some sort of receiver driven digital dial can sometimes be fright
night, in disguise. A simpler approach, may have merit, may cost
less since the dialeo thing is already at hand, and be eminently
usable for the average ham.....

In the olden dayz, hams used a growler for frequency checking.
All self-respecting ham stations had one. A growler is just a
simple regen detector with some headphone output so you could spot
yer favorite Hartley or TNT against it by setting the growler first
to the station receiver (usually a regen with maybe two stages of
audio and maybe a stage of rf) and the setting yer rig to match the
growler. Worked fine, still does, for those of us running OT stations.

A modern twist is to use the fancy califragilisticexpialidocious
Januine Yasicomowhooie rig with all its bells and whistles, as
a digital growler..... it is a good use fer them modern things
what don't have controls big enuf ta gits yer fingers thereon.
Back yer drive down to zero, and key the modern digital growler
rig into a dummy load (e.g., a 10 watt lamp or a 6 inch piece of
wire, or somesuch minor antenna device), and it will put out a
milliwatt or two that you can sets yer QRG on yer Boatanchor
receiving set. Works fine, lasts a long time, has lots of pretty
blinkenlights, and the required digital dialeos.

I have been using that for some 15 years or so, and swear by it,
especially if you use things like detectors and one steps fer yer
main station receiving set, which don't have tractable oscillator
thingies to hang one of those digital dials off of.

You might try it, and see if it works for you....

Good Luck! (:+}}...

Hi,

Im looking for the following receiver in good working order for AM DX.

RCA AN/SRR-12

Pick up would be best, Im here in the Bay Area, CA

Thanks for reading this,
Robin

Message-ID: <KBeJ7.314$zW.119069@dfiatx1-snr1.gtei.net>
Source record: 47633

Anyone interested in this? Purchased in '95. The JPS Communications NIR-12
"Professional Dual DSP Noise Interference Reduction Unit."
This would be very useful as an outboard DSP for an older "boatanchor." If
you are interested please make me a reasonable offer. It is in perfect
condx and have the original box and manual.
Tks,
Phil, KG6KB

4241. Andy Griffith show boatanchors

Can anyone identify the radios in the Mayberry sheriff's office?

There seem to be different radios in different episodes. Sometimes I see a control head for a Motorola base station and at other times its not there.

What are the other radios they used?

Jim

Boatanchor Bob NA4G <na4g@weedcon1.cropsci.ncsu.edu> wrote:

: In the olden dayz, hams used a growler for frequency checking.
: All self-respecting ham stations had one. A growler is just a
: simple regen detector with some headphone output so you could spot
: yer favorite Hartley or TNT against it by setting the growler first
: to the station receiver (usually a regen with maybe two stages of
: audio and maybe a stage of rf) and the setting yer rig to match the
: growler. Worked fine, still does, for those of us running OT stations.

: A modern twist is to use the fancy califragilisticexpialidocious
: Januine Yasicomowhooie rig with all its bells and whistles, as
: a digital growler..... it is a good use fer them modern things
: what don't have controls big enuf ta gits yer fingers thereon.
: Back yer drive down to zero, and key the modern digital growler
: rig into a dummy load (e.g., a 10 watt lamp or a 6 inch piece of
: wire, or somesuch minor antenna device), and it will put out a
: milliwatt or two that you can sets yer QRG on yer Boatanchor
: receiving set. Works fine, lasts a long time, has lots of pretty
: blinkenlights, and the required digital dialeos.

I will confess to using my HP 8640B, with a rubber ducky hung off
an N-to-BNC adapter on the output, as a growler. It's pretty good
at it, and it's still in calibration, too.

Speaking of which, I've got some other stuff that really needs
to go to a good cal lab, or to have one come to me. I've been
looking in the OKC-Tulsa area, and have come up totally dry.
Any ideas? Maybe in the Dallas/Fort Worth area? Or as far
north as Wichita/Kansas City?

Equipment:
Tek 465B scope with DMM
Fluke 1953A counter
Various sweep generators
Philips PM3055 scope
HP 652A signal generator

Thanks in advance.

--
The Internet is totally out of control, impossible to map accurately, and
being used far beyond its original intentions. So far, so good.

There were 2 different sets- Motorola and later an Eico CW only transmitter- with a mic plugged into the CW jack! and an Eico CB transceiver sitting atop the CW rig.

The Motorola looked like a T1200 or earlier extended local
or wire-line remote unit. These were standard desk units
wired up to a big base station perking away in a closet or
buried under bird droppings somewhere.

I think there were others, but I'd have to sit and watch TV to
refresh my memory. I seem to remember a "G" strip
Compa Station with local control somewhere along in there.

Highway Patrol (Broderick Crawford) had FMTRU80D
Mobiles. I always wondered how the Heavy Metal mic
ever got on the dash clip as BC always seemed to just
throw it back in the window after his famous "2150 bye".

I don't think he ever chased a suspect on foot either.

Each of the tubes listed here have been checked on a B&K 667. All of the tubes listed below test STRONG, have no grid emission/gas/leakage, and have no shorts. The tubes marked "USED" may have discolored glass or significantly vaporized getters, but they STILL test strong. I have no way of in-circuit testing, so I can only warrant that these tubes will test good in a similar tube tester and not be DOA, but otherwise must be sold AS-IS.

I have a Knight VFO for sale. It covers the 80, 40, 20,15 and 10 meter band. It is in good condition and it comes with a manual.
The cost is $50.00 US plus shipping costs.
I am Peter Christensen and my email address is peter.christensen@shaw.ca
Thank you. Peter. VE6LP.

4267. HV tube plate cap connectors w/boot

FS: HV plate cap connectors with leads, Alden p/n 91CCSTLRL. These are a good snug fit on a 6146 or similar size sweep or HV rectifier tube. Cap is hard red plastic with a 4'' long rubber HV cable coming out one side, and has a soft red rubber skirt about 1-1/2'' dia that extends down about 1'' to fit over the outside of tube at the top. Each is still sealed in original foil wrap and boxed, mil surplus. $1.75 each or 4/$6 plus shipping. Email or call 334-347-5281 day/eve.

4269. Best tubes to buy at live auction?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-17 06:31:24 UTC
From: googlyelmo@earthlink.net
Message-ID: <3BF60440.DB16FBD9@earthlink.net>
Source record: 47563

I am going to an auction this weekend, a local "Americana"/Tchotke store
that is going out of business, and have the
opportunity to bid on numerous lots of tubes (perhaps 50 lots, from
50-200 tubes per lot). I am new to working with tubes, so
my question is this: which tubes should bid on?

I had a look over the lots, and much of it is grouped by tube function
(e.g. regulators, rectifiers, octal triodes, etc.) but not
more specifcally than that (except in a few cases where 7/9 pin minis
are grouped, and to some degree by type designator).
There weren't any really old or rare tubes in evidence at the auction
preview; mostly everything from post-WWII. I am not
going to bid on any high value tubes, especially since I cant test them
ahead of time. I just want to get a start, cheaply and
wisely I hope, at building up a stockpile of tubes to build with (and to
a lesser extent keep my few boatanchors running, though
I know what I need there).

So, please suggest the 10-20 most desireable tubes for all around
building with tubes. If you like, and are willing to put in the
time, you could tell me also which types of various functions/pin
count/era/etc. you think are most useful. Some indication of
value would help me too, but mostly I need to know what to focus on at
the auction. And oh yes, I am going to pick up some
transformers too. Any suggestions on a voltages/current ratings to go
with the tubes? I know this is short notice, but thank you
very much for the advice.

The difference between the Valiant 1 and Valiant 2.
Real men use the Valiant 1. Late comers - wannabes use the Valiant 2.
The Valiant II had six meters instead of 11 meters.
The Valiant II was painted pretty (with lousy flaking paint).
What a shame, can't go on CB with a Valiant II.

Lilke anything else, caveat emptor rules . . . .

Best thing to find are the sweep tubes, 6JE6, 6JS6, 6JB6, 6LQ6,. 6HF5,
and 6KD6, as they are used in a lot of ham gear as finals. Easy to
spot, as they are quite a bit bigger than the rest, and all have a plate
cap.

Octal based tubes are also in demand, especially metal envelope, such as
6H6, 6SK7, etc. If they ahve a grid cap, even more valuable, as they
are older than WWII vintage.

Loctals --- these are usually in a 7 serices.

But I bet you will find a lot of 3CB6, 29KQ6, and other odd numbers. These were used in series string tv sets, and their value is pretty much nothing. Not much demand in keeping old sets with these tubes.

1 series tubes are for battery powered gear. some demand, but not much.

Best rule of thoumb, is to stick with 6 and 12 series tubes. VR tubes like the 0A2/0B2 and 0D3 are good ones to find too.

Rectifiers like 5Y3, 5U4 are good, Best ones to find are 5R4, as they are good for higher voltages found in old transmitters.

Stay away from mercury vapor tubes, 866, 872's. They can be dangerous if broken, and most people make solid state replacements for their gear these days.

Check with Global Connections, or WB0W, Inc. they may have HN
connectors. I don't think they are that popular anymore, maybe you can
find an adapter. I'd just change them to UHF or N series as the holes
are the right size

Yup. I guess the cruiser was standard issue with low-band
and everything.

When radio techs were weight lifters and radios actually
improved ride and braking stability. And you kept a brick
under the seat to keep the battery up.

Also I think the long mic cord was the "Extradition" option,
for knocking down fleeing suspects.

Just watch your teeth!

Thanks, I'll follow up on those.

The connector on the unit is easy enough to change, but to change the one on the antenna would be nearly impossible as it is an integral part of its construction.

Valiant II with six meters? Baloney! And they also had 11 meters! And they were plug-in compatible with the matching SSB Adapters. And they are great transmitters!

Source record: 47495

Most Valiants were revered by CB'ers
and bought cheap by them in the 1960's
as hams were abandoning them in favor
of SSB. The Valiant (there is no such
thing as a "Valiant 1") has the 11-meter
band readily available on it's VFO.

Most Valiant II's were abandoned by hams
in favor of SSB and passed over by the
CB'ers (no 11-Meter coverage). Sadly,
most Valiant II's hit the landfill by the
mid 1970's.

Most, if not all, Valiants as owned by
CB'ers reappeared in the 1980's. At that
time, most of the CB crowd became licensed amateur operators. Valiants
started making a comeback to the Hamfest circuit by these newly licensed
hams (and ex-CB'ers) in order to trade
up to newer SSB gear.

The saga of the Valiant continues to this
day in the form of interested hams re-
discovering AM.

This is the truth as I know it.

==========
Not Really! The 12.6 volt winding provides about a 10:1 turns ratio
or a 100:1 impedance ratio. That will match a 500-ohm input to a
5-ohm load. A 6.3-volt secondary will have about a 20:1 turns ratio
or 400-ohms impedance ratio and that will take the 500-ohm input down
to 1.25 ohms. Five ohms is much closer match to 8 ohms than 1.25
ohms!

Best Regards,

Ed
Canyon Lake, TX

I see, Ed. The original post stated the oputput imopedance as being 500
ohms to 5000 ohms, so it seems like a few more turns might make a better
match.

Also... don't forget that a power transformer is not really optimized for audio; it's designed for maximum power transfer at 60-100 Hz; not exactly "Hi-Fi".

AMATEUR RADIO NEWSLINE(tm) REPORT #1266 – NOV. 16, 2001

Amateur Radio Newsline report number 1266 with a release date of
Friday, November 16th, 2001 to follow in 5-4-3-2-1.

The following is a Q-S-T. Ham radio operators respond to a plane crash in New York City and Russia says “No” to No-Code. These stories are first on Amateur Radio Newsline report number 1266 coming your way right now.

(Billboard Cart Here)

**

RESCUE RADIO: HAMS HELP IN AFTERMATH OF NYC JETLINER CRASH

Ham radio operators in New York City, still weary from the aftermath of the September 11th terrorist attacks were called out once again. This, after an American Airlines jetliner in route to the Dominican Republic broke up in flight shortly after takeoff from Kennedy Airport. The Airbus A-300 had 265 passangers and crew. It crashed moments after takeoff setting homes ablaze on thrr Rockaway penninsulia. There were no known survivors. We have more in this report:

--

When American Airlines Flight 587 crashed just minutes after takeoff from Kennedy Airport in New York City on November 12th, the Salvation Army was one of the first groups to arrive at the disaster scene. It brought in several mobile canteens to help feed rescue workers and residents whose houses had been damaged or destroyed.

The Salvation Army regularly uses ham radio operators in its SATERN network to maintain communications between its units at a disaster site. This being the second disaster to hit New York in two months' time, the Salvation Army Incident Commander asked the SATERN disaster command operator, Carlos Varon, K2LCV,to request additional ham volunteers. Operators were needed to staff the canteens and a mobile command post.

Initially up to a half dozen ham stations were to be set up at various locations near the crash site and another at Salvation Army Headquarters in Manhattan. It was anticipated that the communications mission would last three to four days.

Also, according to ARRL New York City and Long Island Section Manager George Tranos, N2GA, the League's Amateur Radio Emergency Service was on standby for the American Red Cross. Hams were later reported as providing communications support to the Red Cross for its operations.

But getting to any assignment was not easy. New York officials initially feared this was another terror attack and put the city into a near lock-down, closing all airports, bridges and tunnels for several hours after the crash. In addition, the crash site itself was on an island, and access to the area was severely restricted. All this made it difficult for ham volunteers to reach their assignments. Finally, they were all told to gather in one place where they would be escorted in by a Salvation Army command vehicle.

Among those who helped organize the ham radio response was Mark Phillips, KC2ENI, the ARR Emergency Coordinator for Queens County. The Rockaway Command station was Joseph Albertus KB2QLE and Net Control on the 147.090 MHz repeater was Michael Lunetta W2MPL.

From the offices of CQ Magazine, I'm Rich Moseson, W2VU.

--

Authorities who found the flight data recorder said it contains information leading to an initial conclusion that mechanical failure of the Airbus jet was the cause of the crash. (W2VU, WB2FXN, K2VMR, N2GA, and communications monitored on the 147.09 repeater)
**

RESTRUCTURING: RUSSIA SAYS NYET TO NO-CODE

The Russian Federation has said ‘nyet’ to no-code. According to the W.I.A. Victoria News, the Federation says that there are good reasons for the Amateur Service to continue with Morse as a license requirement for operation below 30MHz. It also says that it has no plans to make any changes to its domestic licence conditions. Amateur Radio Newsline’s Roy Neal. K6DUE, takes a look at the surprise Russian position:

--

"Keep the Morse Code." That's the position of The Russian Federation. It was revealed by the International Telecommunications Union on the 12th of October, when that organization released a position document for the World Radio Conference of 2003..

The Russian Federation told the ITU that it supports most changes to International Radio Regulation S-25, which sets forth qualifications for radio amateurs. But, says the Federation, keep the Morse code. Reasons? First a strong belief that Morse testing is the big difference between Amateur Radio and the Russian version of Citizen's Radio Services. The Russian Federation also points out that lowering the code requirement in many other nations has not led to a significant increase in the number of hams in those countries.

The Federation says that it surveyed Russian radio operators and found overwhelming support for retention of the code and the Russians say Morse is one of the most effective means of communication in emergencies with clear benefits in reducing interference on the high frequency bands.

What does it mean to the rest of the world, this decision to retain Morse testing? Jim Linton, VK3PC, is the author of Australia's "Morse Code Watch."

He says the Russian Federation's position can be accomodated easily. This because any new I-T-U Radio Regulation S-25 to come out of the World Radio Conference in 2003 will set only a minimum qualification standard for radio amateurs. It will not force that standard on any country.

For the Amateur Radio Newsline, Roy Neal, K6DUE

--

As previously reported, the IARU Administrative Council voted on October 8th to support dropping Morse as a qualifying criterion for high frequency access. It says that Morse testing is no longer relevant to the healthy future of amateur radio. (W.I.A. Victoria, W5YI Report)

THE 100TH ANNIVERSARY OF MARCONI'S HISTORIC TRANS-ATLANTIC RADIO TRANSMISSION

I’m Bill Pasternak, WA6ITF, in Los Angeles, with a late breaking bit of radio history.

December 12th will mark the 100th anniversary of the first Trans-Atlantic radio transmission by Guglielmo Marconi. To commemorate the event, The Marconi Radio Club and The Falmouth Amateur Radio Association radio operators are making plans to celebrate this important historical event from December 11th to the 16th. And in this very rare recorded interview supplied by Q-News, Marconi himself commented on the his first contact across the Atrlantic pond. Take a listen:

--
Audio of Marconi commentary here. No text available. Please listen to audio newscast. Links are at http://www.arnewsline.org.
--

The signal Marconi referred to was a series of the letter S transmitted using CW across the Atlantic from Poldhu, Cornwall England to St John's, Newfoundland. For this 100th anniversary, the Marconi Radio Club will be using the call sign W1AA slash CC and will be operating from Cape Cod, Massachusetts, U.S.A.. This was the location of Marconi's 1903 Trans-Atlantic radio station. Marconi's 1903 call sign back then was "C C"

For exact times, frequencies and modes of operation for W1AA slash CC go to www.qrz.com/database?callsign=w1aa) (K1VV, Marconi Radio Club W1AA. Marconi audio supplied by Q-News)

AMERICA AT WAR: G3 MAY HAVE TO WAIT

It now appears very unlikely that new G 3 personal communications technology will share the same spectrum worldwide. Amateur Radio Newsline’sa Henry Feinberg, K2SSQ, tells us the U-S military has other ideas:

--

While Europe and Asia have reached accord on commen frequencies for the introduction of G 3, the September 11th terrorist attacks in New York City and Washington have convinced the Departrment of Defense to take a different position. The DoD now says that it is not in the national interest to relinquist spectrum in the 1710 to 1850 Mhz band just because that happens to be the same spectrum to be used commercially overseas.

According to the latest issue of the W5YI Report the Cellular Telecommunications and Internet Association says that the Department of Defense will encounter interference from 3 G wireless devices but the DoD disagrees. It says that whatever equipment it has is far more powerful. The DoD adds that it may interfere with 3 G cellular telephones oversaeas but that the cellphones will not adversly impact on the military or its operations.

For the Amateur Radio Newsline, I’m Henry Feinberg, K2SSQ.

--

In other words, over here in the United States, if G 3 wants 1710 to 1850 Mhz -- its going to have to wait. (W5YI Report)

**

AMERICA AT WAR: EMERGENCY CELLULAR TELEPHONE PLAN

Verizon Wireless and the United States government are in the final stages of a deal that would give some emergency officials priority access to the company's cellular network. Under the agreement, about 2,000 federal, state and local officials would be given a code that allows them priority over others trying to make calls.

The system, intended to be used only in times of crisis, would be operational in New York, Washington and Salt Lake City, the site of the 2002 Winter Olympics. Verizon has submitted a request to the Federal Communications Commission, which must review and approve some elements of the plan. According to a government official who spoke on condition of anonymity, others trying to make calls could get busy signals because of the plan. (Published news reports)

**

ENFORCEMENT: FCC TO CB OPERATOR – TIME TO PAY THE FINE

The FCC has told a mid-West C-B operator that he has to pay the price of breaking the rules. This after the agency affirms a $9500 Monetary Forfeiture issued last summer to Klaus D. Kramer of Oklahoma City Oklahoma.

--
The Klaus Kramer story goes back to last February. This is when the FCC received several complaints of a CB radio station operating with excessive power in Oklahoma City. The Dallas office sent agents to locate the source of the transmissions. In the course of the two day investigation the agents traced transmissions to three locations including Mikes Cycle Shop. The latter is a business owned by Klaus Kramer.
The agents conducted inspections that revealed that Mr. Kramer violated Section 301 of the Communications Act by operating radio transmitters without authorization. Kramer admitted to making the transmissions and voluntarily relinquished the equipment. On March 12th the Dallas office issued two Notices of Violation to Kramer. In response to the Notice's of Violation, Kramer acknowledged the violations and indicated that he would discontinue operation of the station. On July 13th, the Commission's Dallas Texas field office issued the Notice of Apparent Liability for Forfeiture in the amount of $9500 to Kramer for the noted violations. Kramer filed a response to the NAL on August 14th claiming that the amount was excessive.
In denying Kramers appeal, the FCC's November 8th order says that its Dallas office has complaints regarding similar operations on two separate occasions in March 1998 and October 1999. In both of those instances, Kramer also voluntarily the offending equipment and on at least one occasion stated that the violations would not be repeated. None the less, the FCC says that its investigation has revealed that Mr. Kramer again: "...violated our rules" in February 2001. Thus says the government, imposition of the $9500 is not excessive and is proper in this case.
For the Amateur Radio Newsline, I'm Don Wilbanks, KC5MFA, reporting.
--
Kramer was given the usual thirty days to pay the fine. He also has the option of further appeals. (FCC)
**

ENFORCEMENT: FCC TO STATION OWNER - YOU ARE OFF THE AIR

Hams are not the only ones feeling the pinch of the Federal Communications Commission action. Five Midwestern radio stations have gone off the air after the agency denies an appeal by their owner who the FCC says was found unfit to continue to operate them.

Back in 1994 the owner was convicted of crimes involving minors. He was sentenced to an eight-year term and was released in 1999 after serving five. Last July he was told by the FCC that he no longer held the minimum requisite requirements to remain a Commission license. Also, that he would lose his licenses to operate the stations within 90 days.

Last month he petitioned the FCC to allow him to continue operating the stations. The FCC denied his request on October 3rd and the stations stopped broadcasting just after midnight October 4th. The FCC says it plans to auction off the station licenses. The owner is reportedly considering an appeal. (FCC, other published reports)

**

FCC NEWS: MASS MEDIA BUREAU APPOINTMENT

Nina Shafran has been named Deputy Chief of the FCC’s Mass Media Bureau Audio Division. Shafran joins the Commission from the staff of the Dow, Lohnes & Albertson communications group where she specialized in broadcast matters. (FCC)

**

HAMVENTION UPDATE 2002: DISPELLING RUMORS

If you are one of those who heard a rumor that the Dayton Hamvention is leraving its longtime home at the HARA Arena, then forget it. Its nothing more than the normally irresponsible Internet rumor mill working overtime. Bill Pasternak, WA6ITF, has more:

--
According to planners posting to the official Hamvention website, the erroneous rumor began the week of Hamvention 2001. This, after it was was allegedly printed in a Chicago newspaper that the HARA Arena had been sold. It had not been.

The Hamvention Committee spent the weekend of the 2001 event reassuring its vendors and attendees that HARA had not been sold. Also, that Hamvention's contract had not been "bought out" and that it would be back at HARA.

But that’s not all. The HARA Arena management issued its own formal statement. It also satated that the HARA had not been sold, and that it will not be razed. We at Amateur Radio Newsline were there. We heard it first hand.

Most important the HARA folks reitterated what the Dayton Amateur Radio Association has stated. The Hamvention will be there as promised. And as those of you who received last months mass mailing already know, the dates are May 17th, 18th and 19th, 2002. We will see you there.

For the Amateur Radio Newsline, I’m Bill Pasternak WA6ITF in Los Angeles.

--

So much for the rumors on the Newsgroups and other internet gossip spots. The real story is always at www.hamvention.org. (DARA)

EMERGING TECHNOLOGY: DTV ROLLOUT UPDATE

Roughly two-thirds of commercial television stations plan to broadcast a digital signal by a federal government deadline of May 1, 2002. This, according to the National Association of Broadcasters.

In a report to the Federal Communications Commission, the industry group said that many of those that won't make the deadline are waiting for equipment to be delivered and expect to have digital broadcasts on the air in the months afterward. But some stations in smaller markets are having a hard time paying for the upgrade, the association says.

Right now, most home television sets in use receive only analog signals. But congress has mandated that broadcasters must give up their analog channels to the government by 2006. As a result, there are concerns that consumers won't have made the costly upgrade to
televisions that can receive digital signals by that date. (News release)

**
HAM RADIO IN SPACE: ISS TALKS TO WISCONSIN SCHOOL

Students at Tremper High School in Kenosha, Wisconsin, asked questions the morning of November 6th of the International Space Station Expedition Three Commander Frank Culbertson that got some very personal responses. Culbertson told the teens that he certainly did not expect as much to be happening on Earth during his stay at the orbital outpost, in obvious reference to terrorist attacks. He said that he wished that he could have been with his family during the most stressful times, but he took comfort in knowing that they were strong, and could get by.

On a brighter note, Culbertson said that his current mission is the high point of his space career. He added that he hoped some of students at Tremper High can do the same thing some day.

In response to another question, Culbertson said that he hoped to see cheaper access to space, and hoped for a manned Mars mission and a permanent lunar base during his lifetime.

The contact was an event facilitated through the Amateur Radio on the International Space Station project, sponsored by AMSAT, ARRL and NASA. In all, fourteen students asked one question each during the contact. About 60 other students and a few teachers witnessed the event in person, while M-S-N-B-C carried the audio portion of the contact live over its website. (ARISS release by Gene Chapline, K5YFL)

**

HAM RADIO IN SPACE: NEW ANTENNAS HEADING TOWARD THE ISS

The International Space Station could have a new set of ham band antennas by early in 2002. The antennas are expected to be trtansported to te ISS this month and installed around the perimeter of the Service Module. This will give the I-S-S ham station high frequency, VHF, UHF and microwave capabilities.

The most interesting of all the new antennas is the high frequency array. Its made up of a two and one half meter long flexable tape that will definately work on 10 meters and holds posibilities on 15 and 20 as well. This particular antenna was a joint effort of the Italian, Russian and United States ARISS design team. (ARISS)

**

HAM RADIO IN SPACE: STARSHINE NEEDS TELEMETRY REPORTS

Ground controllers of the Starshine-3 ham radio satellite are seeking volunteer amateur radio operators and others worldwide to monitor and report telemetry from the recently-launched satellite. Starshine 3 transmits 9600 bit per second AX-25 protocol packet telemetry every 2 minutes on 145.825 MHz.

The satellite’s primary mission is to involve school children from around the world in space and radio sciences. Students should be able visually track the satellite during morning and evening passes by recording its telltale mirror flashes and reporting their observations to Project Starshine. To report Starshine 3 telemetry or to learn more about it, please visit http://epulation.com/starshine/starshine3. More information about Project Starshine is available at www.azinet.com/starshine. (STARSHINE vis AMSAT-NA)

**

CONTESTS: THE PSK-31 DEATH MATCH

Call it a truly different kind of contest. This, as the Michigan DX Association announces that it will sponsor the PSK-31 Death Match. The dates are December 7th through the 9th and a trophy will be awarded to the highest overall score. Just what is the PSK-31 Death Match and what are its rules? You can find out on the web at www.geocities.com/mdxa1/death match.html (Internet release)

**

DX

In DX, a big surprise for 6 meter enthuiasts. Jeramy boot, G4NJH, has the details:

--

A combination of high solar flux and low magnetic activity provided world-wide F-layer propagation on 50MHz during the week up to the 4th of November. Strong backscatter and the occasional Sporadic E openings meant that all continents were worked from the UK on 50MHz during the course of the week.

On Tuesday, the 6th of November, a solar coronal mass ejection hit the earth's magnetic field at 0150UTC and triggered widespread auroras. Observers as far south as central California reported seeing vivid displays of the Northern Lights, although we had no reports of visible auroras in the UK at the time of compiling this bulletin.

--

As we go to air 6 meters remains a worldwide D-X paradise. More information is on the web at www.rsgb.org and on the subscription VHF reflector. (G4NJH)

In other D-X news word that two Spanish operators will be in Cameroon between the 11th and 23rd of November. The pair will be working on the installation of HF and VHF stations in hospitals and missions. In their spare time they will be on the air as TJ2RSF on the High Frequenvcy bands. Activity will be mainly SSB, with some RTTY and CW. (VHF Reflector)

And Chris Post, N3SIG, who is a Firefighter and EMT in the United States Antarctic Program at the McMurdo Station on Ross Island is now active as KC4/N3SIG until March 2002. Post told the Ohio Penn D-X newsletter that he will be active every other day starting around 2000-2100 Eastern U.S. time primerally using SSB on 20, 18 and 15 meters. All QSL cards go to AI3D and be sure to include an S-A-S-E. (OPDX)

**

THAT FINAL ITEM: HAM RADIO IN LEBANON

And finally this week, a look at how ham radio is able to survive in Lebanon. Q-News Graham Kemp, VK4BB, looks at the nation, its licensing system and its Amateur Radio Community:

--
Wireless communication was first introduced in Lebanon by French soldiers during the French mandate; consequently, a number of curious and interested Lebanese took on this hobby and started operating under a permit and a call sign provided by the French Authorities.

With Lebanon gaining its independence in 1943, the Ministry of Post and Telecommunications become the issuer of the license to own and operate an Amateur station.

In 2000, there were 230 licensed ham operators in Lebanon, and anyone over 18 years is eligible to acquire a radio amateur license.

Maximum authorised transmitting power is 1,000 watts. The exam is prepared by RAL and is supervised by governmental officials. It comes in three separate parts, which involve multiple choice questions which include theoretical questions on electronics, antennas, and other technical information. Also rules and regulations of amateur radio, and the laws of communication. Also, a test on how to establish a vocal contact over the air.

Their Society is the RAL-- the Radio Amateurs of Lebanon which, like ours represent him or her before the Local authorities and the IARU

From Q-News Australia, I’m Graham Kemp, VK4BB, reporting for the Amateur Radio Newsline.

--

Truly an amazing story of how ham radio can survive even in the midst of geo-political problems that have plagued the Middle East for as long as man can remember. (Q-News)

FS: New in Box - one pair EIMAC 8874 / 3CX400A7 tubes. These were sold by Motorola to be used in some of their two-way radio/repeater stations, such as the 250-Watt Output UHF MICOR series radios, so Motorola put a part number sticker on the box (Motorola part # 97-10886A01), but inside are brand-new EIMAC 8874's with the EIMAC info and installation sheets. I was keeping these for my Alpha 76 HF Linear Amplifier, but now I've sold the 76 and purchased an Alpha 87A which uses 3CX800A7 tubes instead, so I don't plan to use these new 8874's. New ones from one of the major RF Tube dealers that advertises in the Ham Magazines are $459.950/each, plus shipping. I'll sell this new pair for $595.00 shipped and insured.

True. But the filiment transformer does work reasonably well. Better than I thought it would. Not as good as a 70.7 volt audio transformer, though.

Source record: 47508

Hi Rob,

You are correct. The directional coupler is the sensory portion of an SWR meter. Many SWR meters have that coupler built in to them. The advantage to having it separate is that you can construct a measurement system with the sensor in a remote location and the meter portion usually located at the operating position.

The directional coupler will provide a DC voltage output at the forward (incident) and reflected outputs that is proportional to the detected RF on the transmission line.
These DC levels are then normally delivered to the metering circuit over a shielded cable.

There was probably a Johnson meter to which the coupler was connected but I do not have the part number for it here. Perhaps someone will be able to supply the Johnson assembly or some info regarding it.

rob34 -

I have an entire unit (coupler, cable, and display) which I would be
glad to send to you for $20 plus shipping. It's lightweight. There are
a couple of cracks in the meter cover, but that is the only blemish. I
used it for several years when I had a boatanchor station, but it's been
on the shelf for about 7 years. Time to pass it on to another good home.

Regards,

Dave K9SW

I tried this with a 12 hour only clock which satisfied my every desire
except for being 24 hours.

I found a pin on the micro which, when pulled high or low (I forget)
switched it to 24 hour time. I was all proud of myself and put the
thing back together. I don't even remember at this point how I
determined the thing was in 24 hour mode. I seem to remember I
compared it to another true 24 hour clock with the same clock chip and
saw
how the other one did it.

Until, later that evening, I noticed the readouts were looking funny.

What had happened was there was no provision on the PC board for the
readouts for converting the leftmost digit from a '1' to a '2', for 24
hour time. The micro could drive the readouts for 24 hour, but the
readout
board could not display 24 hour time.

Back to the drawing board.

>As for long term accuracy, I think what we are seeing is a move

>as a frequency standard.

I posted a notice here and found one of the earlier MFJ LED 24 hour clocks which was AC powered. The current ones are DC powered, which means they do not use the line frequency as a reference. My experience with internal clocks for reference has been pretty poor.

A nice gentleman sold me the earlier MFJ clock, nice large bright LEDs and
AC powered with line freq for a reference for a few dollars, and now I are
happy!

Even attempting to trim clocks with internal oscillators for perfect accuracy is not always effective. The aftermarket Sony stereo in my truck, not an inexpensive one, keeps great time during the summer. Come this time of year when it cools down, and it loses a few minutes a
month.

The similar model Sony aftermarket in my wife's truck does the opposite.

Of course, you have no choice in automotive applications, but for line powered gear, using the line frequency as a reference seems logical. Battery backup with a clock running from a 9 volt battery on my wife's bedroom clock radio loses 5 minutes an hour, but it is close enough to trip the alarm and wake you so you are not late for work.

Confucious say, 'Man who have only one clock knows what time it is. Man with two clocks never quite sure ...".

I have a Hickok 539A (it's different than the B or C) and
it's been worked on before. That means it's a real challenge
to work on, to say the least. I could really use calibration
instructions or a repair manual. I'll happily pay copy costs
for one, but I'm definitely in need! I've got most of the
calibration completed, but I'm at an impasse right now.

If you can help please drop me a note.

Thanks very much!

Sorry. Not for sale. One of these days - probably when we're snowed in - I will put in a different receiver, replace the oscillator, make the power supply external (it runs hotter than a two-dollar pistol; bad design).

Hi Steve:

You missed 2 points.

One was the definition of classic.

My dictionary says that "classic" means outstanding, first rate,
consummate. That doesn't translate to it being hard to obtain for
anyone, including cb ops. Classic doesn't mean scarce.

Two was in thinking that a TS-940 is a "regular" radio.

The number of new units sold over the same time window shows there was
little else in the market that compared. Today, the current resale value
of them today further reflects their superb price/performance. Its a
deep set of features that are very well implemented.

What radio of comparable performance comes to mind?

73,

John/WD1V

Source record: 47449

FS Heathkit SB-220 Amplifier. This is the one for which I have asking seeking help. From all the input that I have received, it appears that there has been a grid to filament short in one of the 3-500Z tubes. When this happened, it took out R3, the 82 Ohm Shunt Resister in the Grid Current Metering circuit, and the 1 mH RF Choke in the Ground to Grid circuit of the tube that shorted out. Everything else looks good. There is no evidence that the filament transformer was harmed. I have a new R3 Shunt Resister, but the local electronic parts place does not have the RF Choke. I am sure I could order this part, but am not crazy about risking a new 3-500Z to test it out.

This is a one owner amp that I am selling as part of an estate. It has the original tubes with 7611 date codes. It has not been used much. It looks very good. There are several small stains on the front panel. I am not sure what caused them. The cabinet had a ding on the rear corner, but overall the amp looks great. Knobs and Meters are all original and look good. I am going to offer this amplifier to someone who is more technically inclined than I. It will need at least one new 3-500Z and an RF Choke. I don't think much more. I understand that the Zener Cathode Bias Diode is often taken out by a grid to filament short, but I have not tested it. Also, the reason the grid to filament short occurred in the first place needs to be looked at. It appears that the main cause for this is unwanted oscillations at around 110 Mhzs. There are some cures for this, but I am not sure that I understand how to perform them. If the amp were working, I figure that it would bring around $475 to $525 , so I am going to price it at $250. I will also consider offers. Thanks, Charlie Hugg, K5MBX

Most of these cables were made up custom by each owner or installer
(in the case of mobiles. The rigs just came with the connectors.
Elmac did make available 2 accessory cables, one a 23-footer and the
other about a 9-footer.
That is not an octal connector, it is an 11-prong. All pinouts are in
the manuals, and many different cable connections were used according
to the nature of the installation. The most common arrg't for the
mobiles using all your mentioned gear items, and like the accessory
cables offered, had the pwr switch going through the PMR-8 rcvr (i.e.,
can't turn on xmtr without turing on rcvr), had another small Jones
for the 12vdc relay ckt, and another for the S-meter accessory
(without which you couldn't operate the rcvr unless you jumpered it).

I have the shorter accesory cable myself, and think it may be faster,
easier & better 4 U to make up your own from the pinouts than to try
to find this very rare accesory.

Hi there,

I need some slugs to tune my CPRC-26
(1960s VHF Army backpack).

They are not the normal type that go inside the coil.
These are small ferrite rings that suround the coil,
and have a thread on the outside.
They are 11/32 inch (9mm) external diameter,
1/4 inch (6mm) internal diameter,
and 5/32 inch (4mm) high,
as near as I can measure.

Please let me know if you have any,
or where I can obtain some.

4368. FS: Halli Cabinet SX-42 SX-62

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-20 03:01:16 UTC
From: Dave Ragsdale <dave@ragsdale.net>
Message-ID: <3BF9C77C.82F79626@ragsdale.net>
Source record: 47460

For Sale:

Hallicrafters cabinet. This is the standard cabinet for the larger communications receivers from the 40's and 50's. It came from a S-47, but I believe it will fit the SX-42, SX-62, SX-101, and some other receivers and transmitters. Fits a chassis that is 15 1/2" deep X 19 inches wide X 8 7/8 inches high.

It should clean up pretty nice, but would look great with a repaint. Has some masking tape on the sides. 6 small (1/8 inch diameter) holes in the lid. Has one very small dent to the right front of the lid - this should straighten out easily. Has the original feet in good condition. I have posted a picture here:

http://dave.ragsdale.net/hallicab.jpg

I am asking $75 plus shipping (UPS will call it a 30 lb box due to the size) from zip 93401. You can check out my ebay feedback under user "oldradiostuff".

Please email dave@ragsdale.net

Thanks, 73

Cleaning shack.
I have for sale the following equipment
A Hallicrafters S-77 receiver with its manual. It functions very well
and its cabinet is a 7 because of scratches.
The price is $50.00 US plus shipping costs.

A Heathkit HF general coverage receiver. It is solid state, works well
and it is a 8+ in appearance. It has AM, CW, and USB. The price is
$30.00 US plus shipping costs.

A combination of a Heath kit HR-1680 receiver HX-1681 transmitter,
and its' power supply the HP-23B. These units are in pristine condition
and their manuals are included. They cover 80, 40, 20, 15 and 10 meters.
They are solid state units except for the transmitter's output tubes.
The price is $250.00 US plus shipping costs.

A Heath kit HR-1680 also in excellent condition. Its' price is $80.00 US
plus
shipping costs.

A Knight VFO model 77 covering 80, 40, 20, 15, and 10 meters, with its,
manual.
It functions very well.
The price is $35.00 US plus shipping costs.

I am Peter.christensen and my email address is
peter.christensen@shaw.ca
Thank you. Peter.

>do not have the part number for it here. Perhaps someone will be able to
>supply the Johnson assembly or some info regarding it.

I wonder if this coupler would work with the meter built into some Matchbox models.
In fact, I'd bet the coupler was originally part of a Matchbox, especially if it has leads coming out of it with banana plugs. 73, Mike K. AA1UK

Battleship Texas Radio Rooms Restoration Project
The Houston Vintage Radio Association Working with The Battleship Texas Museum
Is in need of manuals and parts for TCS Radio Set and RBM-3 CCT-46076 receiver. The one part that is in great need is the nine pin plug on the TCS Radio
Set power supply a GK-9-32S.
The Restoration Project is in need of all types of pre 1947 test equipment
that would have been on the TEXAS.

The long term goals are to restore the radio rooms to 1945 appearance and to open them to the public. The transmitters in the transmitting room and receivers in the receiving room will be cosmetically restored. Missing equipment hopefully can be obtained.
http://freeweb.pdq.net/fxc/battleship.html

Do have quite a bit of WWII test gear, but no idea
if it is correct for Texas. Can you send a list?

I do have that table on page 502 of the 3rd Edn of the RSGB Hbbk. I'm looking for the info. on the other specs like audio response characteristics, and currents or voltages. I suppose that might not be easy to find. One might need to see a copy of a Woden brochure.

Rich

================
Measure seconday inductance and do a little arithmetic.
Compare physical size with an ordinary mains transformer of known
rating.

4399. Six Capacitors, Oil Filled, 35 mfd 2000 volts - Ebay

Newsgroup: rec.radio.amateur.boatanchors

Six Capacitors, Oil Filled, 35 mfd 2000 volts - Ebay

I purchased these at the Dayton Hamvention a few years ago for $60. There are six, all of them 35 mfd, at 2000 volts, oil filled. (I was going to build a big amp, and use them series/parallel to give me 52 mfd at 4000 volts). The dimensions of a single capacitor case are: 6"x 4"x 3". There is a set of mounting clamps for each capacitor.

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1299911640

Other items:

Running Time Meter, Measures Hours

This running time meter reads in hours and tenths of hours. Timer scale is 10,000 hours, and currently reads 0.2 hours. This meter runs on 115 volts. It was made by Industrial Timer, Model C-25, and it is still in production. If interested, I'll send you the manufacturer's PDF file that describes the meter's specifications. It is in very good condition.

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1664045217

Rotary Inductor

This inductor has 20 turns, and a coil diameter of 3 inches. The overall length, including brackets and shaft is 9 inches. Overall width is about 4 inches, and height is 4 3/8 inches. It is very well made with smooth action, and a well designed contact mechanism.

For auction on Ebay, click on:

4401. FS: Hickock 752A Tube Tester

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-20 23:41:32 UTC
From: Michael Melland <w9wis@charter.net>
Message-ID: <tvlqk4b52s5ja6@corp.supernews.com>
Source record: 47493

Due to a very recent equipment upgrade in the shop and the
purchase of a new Racal receiver I am selling the following
tube tester... and offering it here until tomorrow when I try eBay. I
earlier sold my TV-7D/U and had planned on
keeping this one but you know how that goes <grin>.

Hickock Model 752A Tube tester. Excellent physical and
electrical condition. Was used in a lab at a University
until stored in 1980. I have owned it since 2000 and am
it's second owner - University was the first. A few small
scuffs on the case but you pretty much have to look for
them. I lead a sheltered lide but it's as nice of a 752A
example as I have seen. Included is the original plate cap
leads, original operators manual with current and obsolete
tube data (appears to be a 1965+/- 752A) as well as what may just be the
last Hickock data manual... for the 752A from
1978.

For those not well versed on the 752A here is some info. It
was a later continuation of the 539 series aimed at the
communications/audio industry. Unlike the 539 series the
752 reverted back to a single meter (Hickock found the
seperate grid and line meters were not really very useful).
The 752 added a second variable grid selection, the ability
to actually test voltage regulators for turn on and drain
characteristics and the ability to test both stages of a
twin triode with one button. The tester reads in microhmos,
has 15 sockets that test all tubes known in 1959+ Nuvistors
and Compactrons. The 752A was produced to the mid 1960's and it was the last
"classic" design Hickock with the well known 83/5Y3 circuit. I have digital
pics available... if you want to see them drop me an email.

Asking $375 plus shipping for this great tester. Not cheap
but they are getting hard to find in this condition. This is
a big, heavy tester so shipping costs are actual UPS costs
for insured shipping to you. Guaranteed not DOA and working properly but as
with all electronics of this age sold as-is.

Thanks much for that offer, Rick... but I've managed to find a couple.
Another ham, Mike, K9UW, kindly alerted me to the fact that these are still
made for electric fence chargers!
I had to go to 3 different hardware stores, but finally managed to find a
couple at a local hardware/feed store.

So... if anyone needs these for old boatanchor gear, they are obtainable at
these places.

Thanks to you both... much appreciated.

73... Stu, N1SC

4404. Antique Thordarson Spark-Gap Transformer - Ebay

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-21 00:15:17 UTC
From: Dan Long <w4tq@mindspring.com>
Message-ID: <9teroffkn1@slb0.atl.mindspring.net>
Source record: 47396

Antique Thordarson Spark-Gap Transformer - Ebay

This is an amazing device that was probably made in the mid teen's of the previous century (has a patent date of 1908). It is a Type "R" ½ kW, 110V, 60 cycle Wireless Transformer with a 10,000 volt secondary. It has a movable core section that is operated with a lever. I have not made any attempt to clean it, or otherwise improve its appearance. Although I can find no evidence of any burns or electrical damage, I have chosen not to apply power; and accordingly, I am not guaranteeing functionality. This is a very high voltage transformer, and I'm not sure of the longevity of the insulating materials.
One of these is featured in the Western Historic Radio Museum in Nevada. See their online picture gallery at this URL:
http://www.radioblvd.com/WirelessPhoto.htm

This text appears in the Wireless Museums description: "These high voltage transformers were commonly used in amateur spark stations. The primary is keyed via the AC line (with kickback preventers) and the secondary connected to the closed circuit (usually an oscillation transformer, charging condenser and rotary spark gap.) On a 1/2KW transformer the secondary voltage is about 12KV. The sliding section moves a portion of the core in and out allowing for adjustment of the current capability and resulting power output. The Type R sold for $21 in 1917."

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1299939895

I will be glad to provide additional information, or send more detailed pictures to your email address. Contact me at w4tq@mindspring.com

4405. Electrovoice 638 Mic

Newsgroup: rec.radio.amateur.boatanchors

From: Bill Ogden <wogden@attglobal.net>
Message-ID: <3bfaf9c4_1@news1.prserv.net>
Source record: 47397

A Long Time Ago I bought this microphone as part of a total Heathkit station. The rest of the Heathkits are long gone but I still use the mike (on a Tentec) during the few times I am on phone. I am told it sounds a little mushy. Does anyone know if one of the Heil elements can be used to replace the original element without too much trouble?

Thanks

Bill

I know of no cross-replacement for the 0D3. They are readily available,
though. As another poster mentions, check the dropping resistor. The
tube itself rarely fails...unless its broken :-)

North American model, has American tubes and SO239 connectors, not truly sure which model of 17 it is. Lights up and has sound from speaker, did hear weak signals but probably needs work to be fully functional. Looks great, film dial in excellent shape, no cabinet or manual. Sold as is for $285. Email direct if interested, thanks.

Bill -

I believe that the EV 638 uses a crystal high impedance element. How are
you matching
this high impedance to your transceiver ?

(most modern transceivers use low impedance dynamic or
electret condenser elements).

4410. FS- SX-96, HQ-110, Echophone Commercial

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-21 02:04:53 UTC
From: jm <jdm@iland.net>
Message-ID: <3BFB0BC5.6D34AE4B@iland.net>
Source record: 47402

I have for sale a Hallicrafters SX-96 receiver, am, cw, ssb. Looks good and works ok.. Guaranteed not DOA, sold as is for $115.

Hammarlund HQ-110, no clock, looks great, receives but could probably use some help. Guaranteed not DOA, sold as is for $100.

Echophone Commercial, some light cabinet rust on top, looks ok other than that, power cord cut off so untested, as is for $30.

All items plus shipping from Missouri 65301. Email direct if interested, thanks.

4411. FS- Navy AN/URR-44 HF receiver

I have a few extra National SW-3 (or SW-5) coils to trade for other SW-3 coils
to complete my set.

For Trade:

General Coverage:
Blue coil set (both coils) covers 1.5-2.7MHz (great for 160 meters)

Amateur Bandspread:
10A (Brown) 10 meter RF coil - without padder
14A (Green) 80 meter RF coil - without padder

Let me know what coils you may have to trade.

Jon,
K1VVC

Source record: 47408

Boy.....A LOT of mis-information going on here. The Valiant II (Two) was pretty much the same rig INSIDE as the Valiant. Outside they have different paint,knobs,meter,etc. The Valiant II also had a matching SSB adaptor that would plug into the back of the rig.
The Valiant II DOES have 11 meter band position just like the Valiant. The RANGER II was the one that did away with 11 meter band and put the 6 meter band in.
I have had both the Valiant and Valiant II and both are good rigs. The only real gripe about the Valiant II is the paint was very poor and would flake off.

Generally it was not common to rate mod iron of the day for freq response, because speech amps were most all designed to clip or attenuate anything outside of 300-3000cps, in the interestes of intelligibility and reduced bandwidth. No one wanted or gave a flying one about anything else. You aren't gonna find any "hi-fi" older ham-type mod iron. It all has generally decent freq response itself, and it is the rest of the ckt that will determine how your does.

As another has hinted, you can also determine power rating closely enough by weight.

Source record: 47413

Hello -
Can someone tell me whether there is a decrease in sensitivity above 15 mHz with the R-388? The nominal sensitivity is 5 uv so it seems that a drop off would really affect the reception of the upper part of the HF spectrum. Any comments appreciated. Thanks.

73,
Bruce K6RQR

Not being much of a 'phone person, I just plugged it in. The connector (4-pins) matched OK and the pin-outs must be correct. The mike control and processing control are used in their "normal" ranges, so it must be matching reasonably well somehow.

I gather that the internal element is actually bonded to the head somehow and changing it would be non trivial. I will probably leave it as is.

It could be a few things; the RF assembly could be out of alignment. Below 16MHz, the RF rack moves at a rate of 1/4 inch per MHz, while above 16MHz, the RF rack moves at 1/8 inch per MHz. Alignment could help this. Another problem that shows up in the 51J series of receivers is one of the resistors in the voltage divider that sets the AGC bias. This resistor happens to go up in value. I can't remember whether it was a 750 Ohm, or what the value was supposed to be. It has been a few years, since I had an R388.

That SX96 is a good receiver; it was very similar to the SX100, except without the antenna trimmer. It did use a dual-conversion scheme, with that 50KHz 2nd I.F.

Bruce,

I'm no expert on the R-388, but I'll offer one tiny bit of info.

I saw in Electric Radio some time back that the R-388 input circuit was originally designed for use with high-impedance antennas. It is definitely not meant for 50 ohms. The article described a mod to make it more like the 51J series, which were meant for 50 ohm antennas.

If the above is correct, it would explain an apparent loss of sensitivity with some antennas.

Hello,

We have now an extensive range of high voltage transformers for valve amplifiers and other valve equipment in stock. 230V primary and secondaries for both anode and heater circuits.
Pictures, technical data and price can be found at my web site - www.demostenes.no
(click on the English flag on the left side of the opening picture to get English text).

Best regards,

Arnold Goks yr

DEMOSTENES - N6899 Balestrand, Norway
Tlf. +47 5769 1340 Fax +47 5769 1267
http://www.demostenes.no

Thousands of different valves in stock as well as sockets,transformers,books,caps,resistors and other components. Web site is updated every week. You can order on-line.

Hi, Jimmie;

As a boatanchor hobbyist, I would be pleased to supply TCS parts for use in your restoration effort. Please send me a list of your TCS parts needs and I will let you know what I can provide. On the little stuff, all I ask is a thank you letter on your organization's letterhead. Also email me the your postal shipping address.

Regards -- Brad Whiting KD7GDT

My 51J3 (actally an R-388) had major AGC problems, but ISTR it involved a leaky capacitor, not a resistor, but maybe I had to replace resistors too. It's a rather unusual and complex AGC system, much like that used in early 1930s radios before diode detectors became common. How it integrates with the RF Gain control, to provide an AGC threshold, is also interesting.

FWIW, I never felt my R-388 was particularly "hot" on any bands. Does not have that solid background of static that means a radio is really dying to pull something in. Back when I had a 75A4 it felt about the same too. Probably needed some work. --Mike K.

Jim, the info you got from 'Electric Radio' was not correct. Art had
the R-388 (51J2) designed for 50 ohms. The R-388s I had at the 8th
Army MARS station in the late '50s had very good sensitivity on 10
meters (cannot say the same for the R-390 I had tho - sent it to the
repair shop several times with no improvement).

Alright! I've been hoping they would do that for years. "It's always
been locked up most of the time". I don't have any real old stuff like
that. I have old QST's from that era that could be used for some info
on ham gear, but I bet all the stuff in that radio room is commercial
type stuff. May not be much good. I'm in the Houston area, and have
worked a special event station on the Texas, but we were in the old
combat information center. Thats another place that still had some old
gear in it when we were there. I remember seeing old 40's era radar
gear in there. We strung up dipoles outside, and worked all bands
160-10. Even had an amp going in there. That was about 1985 or
somewhere about that time. Was before they overhauled it. We had quite
a few people operating. I remember it was winter...Almost froze to
death on that thing that friday night we were on there. That ship gets
cold with all that metal..If you need any help doing anything, send me
a note. I'm good in QRZ, etc. I'm in southwest Houston. Mark NM5K

I have had several of each type over the years, and when the units were working properly, they were very hot, even up at 30MHz. It didn't make a difference whether it was an R388 or a 51J series of receiver. Actually, one of the hottest units I had was an R388, with the mechanical filter unit installed. The S/N was 124. The unit was unusual looking, in that the dial drum was colored in a dark brown shellac color, instead of the manilla yellowish color that the other units seem to have.
I have also had some that were "dogs" over the years. I didn't know too much about receivers in those days, so I never went into the innards to investigate the problem.

Sign of the times Joe!

Last week as I was driving to work, the news broadcast reported
the results of a poll in Sweden (it was NPR...) that asked people
what they'd like to see in the next generation of cell phones. Among
the top 5 answers were:

* A probe to measure calories in a salad
* A mirror

I'd like to think we, in the U.S., would have answered somewhat
diffrerently, but I wouldn't put much money on that.

Yeah, like a good JFET Volt Meter, or an HF Field Strength Meter. Maybe use that little display with some 10:1 probes for a portable 'scope? Now there's a cell phone with some real usefulness!

Bill....Just go to the book for your TenTec... Do the specs under "mic
input" say high impedance, or low??
I suspect low, so the EV is not a match.
It will work GREAT with A Drake, Collins, Swan etc.

4456. A special one day event on the Battleship Dec. 1st.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-23 16:47:08 UTC
From: Jimmie Stewart <jimmiestewart@worldnet.att.net>
Message-ID: <g4vL7.207495$W8.7697087@bgtnsc04-news.ops.worldnet.att.net>
Source record: 47348

Thanks for all the email offer of part and manuals
keep them coming this is going to a big job.

A special one day event on the Battleship
Texas called "Yuletide Texas" will take place
on Saturday, December 1st. This is a Kid-
oriented Christmas event. The kids will
be able to talk with radio amateurs in other
cities and countries through the BATTLE-
SHIP TEXAS AMATEUR RADIO STA-
TION (BTARS) sponsored by Houston Vintage Radio
Association. BTARS currently has the amateur call
KD5PEA but has applied for the vanity call NA5DV
The WW2 radio call of the Battleship was NADV.
We expect to have at least two transceivers in operation.
If you are a area licensed radio amateur and would like to
participate come by the Battleship on Dec. 1st.
The plan is to set up the station November 24, in our new
area on the TEXAS your are welcome that day to.

Jimmie

4457. Re: Difference between a Valiant I & II?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-23 16:55:15 UTC
From: jackgxyz@one.net
Message-ID: <tvsvpnf4ld3sc6@corp.supernews.com>
Source record: 47349

Jeff,

There ARE electrical differences between most Valiant 1 and Valiant II transmitters. Johnson published a list of modifications for the Valiant 1 that were added to late production Valiant 1 transmitters and the Valiant II.

The biggest difference is that on the Valiant II and late Valiant 1 transmitters, there are two independent bias adjustments on the side of the transmitter at the rear to adjust idling modulator current and idling final current when running the Valiant as an SSB linear amp.

Older Valiants had a power resistor underneath the chassis with two movable taps that interact with each other.

If you are curious about this and other differences, K4XL's excellent BAMA site has the modifications. Johnson calls it "Viking Valiant Information Bulletin #1". Select VAL-BUL#1 at the Johnson menu. There are 4 .jpg files that contain the mods. There is lots of good information in there.

BAMA can be found at http://bama.sbc.edu.

Jack, WB8BFS

4458. Poldhu spark sked -- please forward

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-23 17:06:34 UTC
From: Jeffrey Herman <jeffreyh@hawaii.edu>
Message-ID: <Pine.GSO.4.33.0111230700310.19186-100000@uhunix4>
Source record: 47350

This is an up todate list of the Poldhu schedule for Dec. 12 and their spark tx.

List of operations for 12th December 2001 (amateur radio)

(NB we will stop operation for 5 minutes on the hour for RN experiment with spark transmitter and would appreciate reports back from anyone who hears them)

0800hrs open up at least 3 radio rooms using GB100GM

0855hrs to 0900hrs shutdown for RN

0955 hrs to 1000hrs ditto

1055hrs to 1100hrs ditto

1155hrs to 1200hrs ditto

1255 hrs to 1300hrs ditto

1355 hrs to 1400hrs ditto

1455hrs to 1500hrs ditto

1500hrs official opening ceremony and hand over of keys, speeches etc..

1600hrs PARC will attempt the link up with Canada, Joe Craig and exchange greetings in one radio room.

(during the above times 1500hrs through to 1730hrs the other three radio rooms could continue ordinary transmissions as desired).

1730hrs PARC stop operations and RN take over from then on with their experiment.

1930hrs celebration dinner at the Polurrian Hotel (invitation only, but all Poldhu club members are welcome, just let Carolyn know asap if you want an invitation, £25 per head).

This is going to be a very special day for all of us, I hope that we can all enjoy this and the following weeks when we plan the massive operation of the special call sign GB100GM. We have arranged for a video link from the Marconi Centre to the Marquee that will be alongside the building for any people not able to be in the actual centre during the official ^Ñbits^Ò, but hope that all PARC members wanting to be, will be in the building.

Thanks in advance for all your help and support.

Space will be limited on the day so if you would prefer it why not join us on one of the following days when we will have more time to show you around the building.

Geez, only 20 pages? Seems to me it used to be 32.

Sounds like you got the Christmas Flyer. The list of goofy products is similar to that from 1975 and later years. I'm sure it went back to prior years also.

Does anybody here remember "Solar Cigarette Lighters"? "LP records of CB Radio Songs? ('Hey Shirley, this is Squirrely')" "The 'TV Scoreboard" (a pong game)?" Or, coming up a few years, the "Electronic Wind Chime"?

Actually, RadioShack has more parts now than they did in 1976. The mix is different -- no in-stock tubes, very few cabinets, etc. They have a policy of getting rid of items that gather more dust than sales.

The reason that these types of things are hyped every year is because, believe it or not, people BUY these things.

Jerry

4460. Re: WTB Conversion Manuals

Newsgroup: rec.radio.amateur.boatanchors

> I need surplus conversion manuals for ART-13, BC-375/BC-191

Both of these were covered by SCM#2 (1948), but neither of these articles has much that is mysterious or particularly unknown, as might be the case for many other surplus units of the day. The ART-13 was ready for use on the air as-is & only needed a supply, one of which was suggested there using the old parts of the day (i.e., 866's etc.). The BC-375 was so unstable it was considered fairly useless as an amateur xmtr by the authors, and cannibalized for it's tuning components etc. You may find that for these 2 units, there is nothing you "need" from these manuals - and for opposite reasons each.

4461. Re: Collins R-388 sensitivity

Probably time to recap the whole set and align it on the nose. There are many myths purpetrated about certain older gear today by the neaveau-retro-minded, and reading them in a slick-sounding magazine doesn't make them any more correct, but only deeper in error at a price. The 388 is a J3, it's sense is fairly uniform over its range as part of its own quite-rigid acceptance spec when it is in proper condition, and yes, it's ant is 50-ish ohms. It is also rock-stable, and has one of the better-sounding limiters of the era.

WS-22 is uncommon in Norway, but I would not say it is rare. I got
mine after a few inquiries to collectors, and it was in decent
condition. I will give it a good home.
No, I will not sell it.
You should first visit www.armyradio.com if you havn't done that
already. Visit them regulary. The list many Wireless sets now, but not
the WS-22.
Next, you should try the English part of www.nrhf.no. There is a Buy,
sell, wanted page, and maybe you are allowed to put an advertisement
there. I think it is only for members, but these fellows are nice
people, so you should try.
If you need circuit diagrams and descriptions, I can help you.
Good luck.

The stories about the BC-375 and BC-191 being "useless" are
myths perpetuated by a couple of articles in ham mags
and "conversion handbooks" of the late 40s and early 50s.
These guys attempted to run the rigs with power supplies
and antennas completely out of design specs. They also
didn't know how to tune or operate an MOPA design from 1928.
No matter how much you drill and whack it,
a model "T" isn't ever going to be a sports car,
so why not enjoy it for what it is?

I have used the BC-375 on 160 and 80 meter phone
with good results. Many milradio people use them today.
Several people on the east and west coast military nets
use them to check in regularly. You *do* have to
"do it right," with particular attention to the neutralization
of the rig and adjustment of the keying relay.

If you don't want to "mess with" taming a BC-375 or BC-191,
please let me suggest that you offer it for sale
rather then scrap it. The parts (other then the tubes)
are near worthless. The rigs sell for
a great deal of money these days *IF* and *ONLY IF* they
have not been modified. These radios have passed from being
ham radio curiosities into historic relics.
If you don't want to operate the rig,
please consider selling it to someone who does.

Kindly,
Dave S. AB5S

Model number, please? Also, in most of these, the rewind is a
separate motor, and it would be good to know if the motor has bitten
the dust.

Recently acquired a Globe Scout Model 40. It was the first model and used plug- in coils for the oscillator. Does anyone know the style of these coils..ie vertical wound on coil form OR open coil link coupled..? Mine had only one coil but not sure it is original. It was marked 20 MEL and was open coil stock with fixed end link coupling.
Help from anyone appreciated. Reply direct to k4cia@mindspring.com or the group

4491. Availablity and use of variable HV and bias power supplies

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-25 04:45:22 UTC
From: googlyelmo@earthlink.net
Message-ID: <3C007762.BEA18ECB@earthlink.net>
Source record: 47385

I just lost an eBay auction (to a "sniper") for a Heathkit PS-4 HV/bias test power
supply. I had never heard of this model before. It has outputs for filament(s),
plate to +400 VDC @ 150 ma, and bias supply to -150V. It looks like just the
thing for someone homebrewing with tubes (or fixing boatanchors), especially a new
guy like myself, without a junkbox full of FP can caps and HV transformers of
various voltages to keep the little rigs glowing. Alas, I lost by $1, less than a
minute before the auction closed! However, now I am "reminded" that variable
HV/bias supplies like this once were made, and I want one.

In addition to the Heathkit PS-4, what other makes and models of these were made?
I seem to remember seeing one like the Heathkit made by Lambda, at a hamfest a few
years ago. What are the best/worst ones out there? The stated specs on the PS-4
sound like they are near ideal for glowbug building. How common a piece of gear
were these wonderful things? Any caveats about their use generally would be of
interest as well, including some idea of what market and/or fair pricing is. If
you have one to sell, or know where to look, I would definately be interested in
making a purchase before Christmas, if possible. Thanks & 73 de

Will, KD7BFX
Seattle WA

P.S. If you care to look, the URL for the PS-4 I bid on follows:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1298818829

CB: (Camel Band). They stay on channels
one and two- depends on how many humps.

Unless he's talking to his headquarters.
Then it's RTB (Rag Time Band).

His Al-Quida bunch are UHF (Usually Have Fleas)
and VHF (Very Hungry Fleas).

He's recently had a problem with USB (Uncle Sam's Bombs).
They say it's because he's LSB (Lower'n a Snake's Belly).
But I think it's because he's FM (Friggin' Moron).
Probably won't be long before he's DSB (Dead Scum Bag).

I have a set of glowbugs I am building. I need 200-300V for the plate of the TX tube (6AQ5A). As an alterantive to buying new or scrounging old HV transformers, I had this idea that Euro (step-up to 220-240) AC travel transformers might do the job, but reversed. Can I switch the inputs and outputs on one of these (I have a 50-watter)? The US-to-EU models run 3 times as much, watt for watt and dollar for dollar, than the ones we use over there (step-down to 115)I only need to draw about 9-10 watts for the rig, so this would take her easy on the windings. How well will this work? THanks & 73 de

You might want to ohm it out and see if its a true transformer. Some of
the real cheap 220 to 110 gadgets are not.
In general, yes you can use the conventional larger xfmrs, lets say >100
VA, in either direction but they are almost always autotransformers
meaning that they may wreak havoc in a circuit unless isolation from
other AC/gnds is taken into account.
The cheapest alternative...can get an transformer out of an old junker
item of some sort.

Eico made one as well, I believe the model 1030. I had one for several years--it came out after the PS-4. Do an ebay search under Eico. The one I use now is made by Stark and is built to somewhat higher standards.

Good luck! You're right--it's terrific for troubleshooting boatanchors and other old radios.

I'm enjoying my TS-430 and 2 mtr operation....but....I also have this
old Apache Transmitter....and would like to get it running
right.....its mass is so impressive!!

I've got the manual and spare tubes.....probably should start
collecting caps! I see electrolytics are Soooo expensive!

So for now....I'm asking around to see if I can find an article
written about modifying the audio......what's this I hear about
"Scratchy Apache"! I guess the thing to do would be to install
larger caps in the audio section.....

So the question is: how I can improve the audio of this old rig?

Hope to get on 75 AM soon....and join the AM's

Thanks,

Al Urkawich KB1LI

Those may be autotransformers as Bill noted. You can buy cheap
filament transformers with dual 110/220 volt primaries. Run two
back to back and you will have both your filament and B+ voltage
needs solved. You can run the backwards primary as a full wave
with center tapped output for 1/2 voltage, as a bridge, or as a
two halfwaves for dual high voltages.

Looking for octal-based calibration xtal that is missing in my sx-100. I don't know if they were generically made or if it must specifically be a Hallicrafters
part. I believe it is 100Kc freq- correct me if I'm off on this. Any info or alternative ideas would be greatly appreciated as I don't know many technical details of xtal application/specifications rather just the basics. Thanks, email daveaust@pol.net.
PS- still looking for bandspread (&/or main) dial for HQ-129-X that has yellowed(actually "browned").

I've seen two HTs in his grubby hands:
A Tokyo-HiPower 7-8 Mhz synthesized SSB (altho it may be uptuned or down tuned from 40 mtrs)

and what looks to me like a Soviet NBFM CB set (27 Mhz +-)(They use NBFM for CB over there, and the freqs are slightly different).

4518. Re: wtb: jrc commercial/maritime receivers

Newsgroup: rec.radio.amateur.boatanchors

None of these are commercial marine; this is the home/ham line.
The marine stuff is NRD-92, NRD-93 etc. See Fred Osterman's book.
Easy tip: if it's rackmounted it's a pro unit.

Amplifier or RF deck I can dedicate to 160-meters. Need not have the power supply, but if it does, so much the better. I am a home brewer, so have NO NEED for the Alphas, AL-1500's, Clipperton L's, and the like - don't bother. If it needs "fixing", so much the better! I will DEDICATE it to one and only one band: 1.8 to 2.0 MHz. MUST also have adequate dissipation to operate AM with reserve (4 X 572B's will NOT do the job). Please reply by email to either:
DaveArea51@aol.com or W0LEV@ARRL.net
Thanks for reading.

Tube type power transformers - NEW.

1) Brescia 10V CT at 10 Amps with 115V / 230V Primary
Will sell for $18.00

2) Raytheon TF15X02YY with 120V Primary.
Secondary is 1100V CT at 180 mA continuous.
Dimensions: 3" X 5.25" X 6.5" tall.
Potted, encased case with four mounting studs.
Will sell for $38.00 plus shipping

3) ADC Co. (AVCO-Crosley) model TF4SX03KA
Has 120V AC primary and two secondaries.
Sec A: 1050 V CT at 75 mA continuous
Sec B: 5V at 20 A continuous.
Will sell for $27.00 plus shipping

4) Also have a great filament transformer for that BIG final
amplifier:
115V / 230V primary.
Secondary is 7.5V CT at 51 Amps.
Brand new. Will sell for $95.00 plus shipping

Source record: 47329

Hi Larry, You have several choices. You can have your old metal trim ring(s) repaired and repainted. K0BS or WA5VVT do a premimum job on these at a fair price. If you are not so concerned with perfect cosmetics but wish to keep the originality of your set, post a query for a metal trim ring on the Collins reflector (go to qth.net)... or check into the Collins net on Sunday afternoons at 20:00 UTC on 14.263 and ask on the Buy/sell/swap portion of the net. If you are not concerned about originality but want a good durable trim ring that looks nice for a fair price, go with the plastic Surplus Sales trim ring. These plastic rings were used on later round emblem series S-line gear, not early round emblem or wing emblem series and in my opinion will de-value your gear just a little. Good luck, John Poland, Wilmington, NC

Bill -

I have a EV 719 on the bench (identical Microphone head to the 638, newer base)

You will need a retainer ring tool to remove the retention ring (automotive tool)
My element is packed with a wax material.

Just because the microphone connectors match does not mean that the impedances match.
My guess from your reports is that the Ten Tec takes a low-impedance microphone and you have
a high-impedance microphone. (which will cause reduce audio output and unacceptable audio response)

Impedance differences (most low-Z are 500 to 1,000 ohm range; high-Z are 10,000 - 50,000 ohm range)
"Matching reasonably well" - Nope, go back to the electronic and amateur radio theory books.

FS in very nice condition and operating perfectly with full output a Drake TR4CW, AC4 and MS4, matching 7075 mic, and the original manual. The rig was stored in a dry room for many years. The owner is a retired ham who unfortunately lost interest and had me take down and remove the tower and antennas. The rigs are consigned to me. I tested the TR4CW out thoroughly. Its nice-plug and play.
price is $350 .00 for all. Thanks and 73s Lew KlNDV

Message-ID: <b_uM7.37$gf.3627@sjc-read.news.verio.net>
Source record: 47340

Heathkit GC-1A Mohican receiver. This was Heath's first solid state SWL receiver. It is now regarded as scarce and collectable. This unit is working and in good external cosmetic condition (some scrapes and scratches, antenna cap is not original). It is a good performer on all bands. It runs on 12vdc via internal batteries or you provide an external AC supply. Has an internal speaker and a whip antenna. It comes with a copy of the Heath manual.

There are some rust spots on the chassis internally and some inside the case as well. The battery box is in very good condition.

See picture at: http://myweb.accessone.com/~stockb/misc/mohican.jpg

Price is $75 plus shipping from Seattle.

4566. FS: Collins 30S1: $1300

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-27 14:23:24 UTC
From: "Joe Giacobello, K2XX" <k2xx@swva.net>
Message-ID: <3C03A1DC.96094A77@swva.net>
Source record: 47260

I am interested in selling my 30S1. I have owned it for about nine years and purchased it from K2BF (SK). The unit is working perfectly and delivering 1.4-1.6 KW output (into a dummy load) on all bands including the WARC bands.

The 30S1 is S/N 678 (WE) and is in good condition. There are some mild scratches on the top and sides and there is a minor dent on the wire cage covering the air vent at the rear. The front panel is clean and unmarred.

The unit has been modified to deliver 1500 watts output with 100 watts input. This modification was accomplished by the well documented procedure of increasing the screen voltage. It is easily reversed by merely loosening several screws and removing a small transformer.

The original three-minute time delay relay has been replaced by a home-brew unit which works flawlessly. (I have two nonworking original relay units also.) One or two of the original cartridge-type diodes have been replaced with more modern wire lead units. The HV rectifier tubes have been replaced by solid-state plug-in modules.

In addition I have a file on the 30S1 which includes many good articles and tips, a copy of an early manual and an original more recent manual.

The price is $1,300 with a pick-up in southwestern Virginia, about 40 miles southwest of Roanoke. If I you're interested, I can demo the unit

in my shack or on the air.

You can contact me via e-mail or anytime at 540-745-6825.

73, Joe

Source record: 47265

Got a un-used, but non-functioning 12 volt Mallory USA vibrator type G629C from a 1945 Pye PCR communications receiver, and need advice on how to gently open it up for cleaning (non destructively).

It is in an aluminium can with a 4 pin base through a hard rubber seal and a solder blob! on the top. The manufacturers printing is in red on the side.

Before I make a mess of the can, is it best to prise open the base around the bottom seal, or cut the can open?

Thanks

Kilo

4574. Military Receivers: BC-800A, BC-1033-A, RDE

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-27 20:04:43 UTC
From: "Norman S. Braithwaite" <normb@awwwsome.com>
Message-ID: <3C03F1DB.BA56F1CD@awwwsome.com>
Source record: 47268

I have recently acquired these receivers (BC-800A actually a transceiver with a video and sync output, BC-1033-A and RDE) in a lot. For what applications were these receivers designed? Should they be preserved? Are any readers interested in them?

Norman

4575. Re: Anyone knows wt's AM and FM stand for?? thx a lot

Newsgroup: rec.radio.amateur.boatanchors

From: Steve <k2pts@home.com>
Message-ID: <3C03F710.1D088313@home.com>
Source record: 47269

AM stands for American Morse code. Used by Americans for Americans.

FM stands for foreign Morse code, such as what we now call continental
or international code.
This code is for foreigners not to be used in the United States of
America.

4576. Need parts: Heath, Ten-Tec, National, Kenwood, Sonar

Newsgroup: rec.radio.amateur.boatanchors

Looking for the following radio repair/resto items:

Heathkit RX-1 Mohawk:
- nice front panel with good paint/lettering, no extra holes
- one small satin chrome knob
- bellcrank from bandswitch linkage
- nice dial drum (yes, I know about the repro's)

Ten-Tec Triton IV or 544 analog:
- nice front panel with all paint/lettering intact (need only the aluminum panel, not the dial bezel and related parts)

National VFO-62:
- outside cabinet, no dents, no deep rust, ok if needs paint
- 1.0 Mc calibration crystal (FT-243 holder only)

Kenwood TM-2550A:
- service manual (or decent copy thereof)
- inline PWB-mounted plug where PL board plugs in

Sonar CB radio Model C, E, G, or H:
- three knobs
- mobile mount
- original hand mic

Miscellaneous:
- one 6CR6 tube (a good used one is fine)

Thanks and 73,
Dean K5DH

Close enough! Back before FM gained popularity, many of the brokered stations survived by selling time to ethnic broadcasters. Nowadays, the AM band is mostly syndicated talk and local, usually ethnic programming.

Hi,

I have 3 pcs of the very scarce EF 14 valves. They are Telefunken and
one of them have even a 'Wehrmacht' label and the datecoding 05 45
They are all unused and two have original boxes. The price is only NOK
929.- or about US$ 103.-
You can look at a picture of them at my web site - www.demostenes.no
Just search for EF 14 in the field down in the left corner of the
opening picture.
E-mail me if interested

Regards,

Arnold Goksyr

Thousands of different valves in stock as well as
sockets,transformers,books,caps,resistors and
other components. Web site is updated every week.
You can order on-line.

4582. Re: 12volt Mallory vibrator type G629C (circa1945)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-27 23:08:40 UTC
From: lbrty4us@aol.com
Message-ID: <205ef942.0111271508.9b5cbcc@posting.google.com>
Source record: 47276

Do NOT open the &^$#% vibrator! It is totally unnecessary, there is nothing good you can do inside of it, and plenty you can or will hose up. That is shade-tree mythology. And all else this will do is be sure that the contacts oxidize even faster next time. You cannot mechanically clean or adjust them without hosing up the mfgr's tuning of the unit, and if it works after you finish abusing it this way, it will be an even nicer hash machine than it already is. If the coil is burned out, toss it and find a new one. If it is good, here is what to do instead of destroying it like a caveman, because it very likely has oxidixed contacts and simply won't start ("work"):

Git yerself a polarized linecord and a 40-watt bulb. Stick the hot side thru the bulb to pin #1 (if you don't know how to indentify its pins & ohm out the thing then leave it alone). Connect the other 3 pins to the cold side. Plug it in. The AC will overcome the crap on the contacts, will drive the bejesus out of it, and will clean the oxidation off the contacts. A minute or so is usually enough, but you can run it on AC like this for quite a few minutes without harm, and/or repeatedly if necessary. Of course, you will need its supply right at hand for testing it after deoxidizing.

OTOH, if you "open it up" and frig with the reed, it will never be right again (if indeed it is still good).

Vibrators DO wear out somewhat rapidly in high-draw communications service, and do often need replacing even when they "work." But do not suspect the vibrator first - always go through the rest of its associated supply components first. On very old supplies (they are all very old now), the buffer cap is usually leaky, and this cap is very critical to the life & operation of the vibrator. It will typically be a 2000 volt cap across the xfrm secondary. Replace with exact value. This capacitance is reflected through the xfrm to the vibrator contacts & is carefully chosen for each supply.

Leaky filters are also extra-hard on vibrator supplies, and also are worth replacing before you even bother to fire it up. Likewise the high-value LV bypass caps, most of which are all junk by now - they aren't shunting their share of the hash anymore & weren't that great when they were new either.

After this, and assuming you now have a working vibrator, you need a scope now to see what it is doing. Run it with the rectifier pulled (we have been talking about nonsychronous vibrators & supplies like yours). Connect across the xfmr & hope to see a fairly good square wave with only one small slope in its rise (for reasons too lengthy to type here). If your contacts are worn, dirty, or bouncing around

wrongly due the the reed being hose up (such as after some dufus has
"fixed it"), you will see the breakup in the waveform. A crappy
waveform will not only hose up efficient power production, but will
produce gobs of RF hash that the hash-reduction circuitry simply can
not deal with. If contact cleaning didn't & won't do the deed, you
need a new vibrator.

Also, it is unlikely your unit is really 12V (though it may be so
marked and intended). Most vibrators from that era are all 6v, and
simply wired differently in 12v (or 24v) *use*. The vibrator always
runs at (nominal) 6v in such supplies.

But PLEASE don't ask how to take it apart to fix it (not). ;-^)

Well that is not fair to say. It is a neat scope in a huge box to
show guests cool audio or low-freq waveforms or loosely monitor your
transmission envelope, and will amaze little children with big
Lissajous patterns. It is flat on top so you can set crap on it,
which is a plus since it takes a half-acre of space. So it is worth
ten bux. :-)

I have for sale the Sherwood Engineering first-IF filter mod for the Drake R-4C receiver. This mod kit appears to be from the mid- 1980's and was recently removed from an ailing R-4C. Included are both the USB and LSB CF-2K/8 filters (5.645MHz first IF) and the 3 filter switch kit. The switch kit consists of one board (two TO-5 relays) that must be mounted under chassis on the long shield, and two more TO-5 relays that mount to terminal strips on the preselector bracket (along with the two filters). Requires drilling two small holes on an internal shield. Includes a copy of the complete installation instructions. $195 plus shipping. I can email jpg pictures of the filters on request. Also see the Sherwood Engineering site at http://www.sherweng.com

Source record: 47289

Anyone have any info at all on this receiver? It's a small rack-mounted receiver made by Sylvania, presumably in the late 60's/early 70's. Has a nixie digital readout and covers 1.5-32 MHz. Was evidently resident at the Vint Hill Farms station near Warrenton, VA, judging from some of the attached tags

The power supply is crapped out and, like most power supply designs of this era, is 100 times more complex than it needs to be. Schematic would be helpful since there are a few wires disconnected as well.

Thanks and 73 - John

Lbrty4us,

Thanks for the reply (and the lecture).

I had thought of applying 12 to 24 volts of AC to try to clear the contacts, but over here the mains supply is 240v.

The PSU has probably never been used, as there were two manufacturing faults inside a soldered up screening can - dead short circuits.

This dud vibrator is the spare from inside the PSU, the main vibrator burst into life after a few seconds hesitation once the various faults were fixed.

Yes, I will change the buffer capacitor, and the other waxed paper cardboard tubes.....etc.

By the way, Ohms law I know, shade-tree mythology I have never heard of?

Thanks and Regards

Kb

They're called Amphenol microphone connectors or mike connectors. They're around, but not worth searching for. I suggest you change it to a BNC connector. Easy to find and fits in the mike connector hole just fine.

You can kluge a PL-259 onto the Amphenol connector but I agree with
Frank...change it.

From: patgkz@aol.com
Message-ID: <20011128152333.09533.00001912@mb-fy.aol.com>
Source record: 47199

Hi Gang.....

Just took delivery of latest eBay purchase: SX-100. Started taking it apart to clean it. I found this stamped on back of the 50Kc amplifer subassembly: 199846 Mark2A.

Also, I found the radio to be completely unmodified. It has all of the original
tubes with yellow Hallicrafter logo's on them. The latest date code that I could find on a tube was "59". The radio is cleaning up well....just very dusty.
I asked the seller (a non-radio type person) where she got. It came from an estate sale with no other radio junque. Very interesting how eBay dealers are beating the bushes.

Now the questions:

How many "variations" of the SX-100 were made? Where does my SX-100 Mark2A fit in on the timeline?

Is "199846" the radio's serial number.

What circuit/performance differences are there in the variations?

Any other comments appreciated.....thanks Hallicrafter enthusiasts!

Pat WB9GKZ, WPE9JRL

4606. FS: Eimac 4CX1000A's (Used and Unused)

Newsgroup: rec.radio.amateur.boatanchors

Source record: 47200

I have for sale two Eimac 4CX1000A's.

The first is unused and was given to me several years ago by a good friend. It is marked as "Electrical Sample" and was reportedly rejected

by Eimac for cosmetic reasons. I checked it out today in my 30S1 using a dummy load and a Weston 0-8A RF ammeter, and it easily delivered 1800 watts, which is above Eimac's specification. The price is $200 plus $6 shipping.

The second is used and I believe it is a pull that I obtained at a hamfest some time in the past. I checked it out today, as described above, and it easily delivered 1800 watts. The price is $85 plus $6 shipping.

Contact me either by e-mail or at 540-745-6825 anytime.

73, Joe

They are the same as used for high-impedeance mike connectors for many years, and many other civilian test equipment probes (scopes, VTVM's, sig gens etc). They are everywhere and should be easy to find, or alternatively one could swap it out with a BNC.

From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <9u45b3$74o$1@uranium.btinternet.com>
Source record: 47214

NOW AVAILABLE ** Program "DIPOLE2.exe

An update of programs Dipole1 and Varney.

DIPOLE2 analyses the performance of any HF dipole of any height and length, at any frequency, plus a balanced feedline of any impedance, length and attenuation, plus a balun of any impedance ratio, plus a coaxial line of any impedance, length and attenuation, plus a "tuner" with an L-matching network. (An L-match always has a lower loss than a T or Pi).

Computed results include R+jX input impedances of antenna, of balanced and of coaxial line. Antenna radiating efficiency. SWR and loss in balanced line, coax and tuner. Tuner L and C values to match system to 50 ohms are computed. And overall radiating efficiency.

If either coaxial or balanced line is not needed set the unwanted line length to zero.

The program tells the user immediately the consequences of changing something at one point in the system which affects something somewhere else. For example, if it is asked should a 450-ohm transmission line be increased or decreased in length to provide a more accurate 50-ohm transmitter load impedance, the program will tell you not only which way to go but the actual change in length which should be made. See Cecil's W6RC website for practical implementation. It will also advise whether a change in feedline Zo might be a better option.

Facilities are provided to search for resonant frequencies of an antenna plus feedline. It will be noticed they are not harmonically related. The effects on resonant frequencies of varying in small increments the lengths of dipole and feedlines can be investigated.

DIPOLE2 is about 70 kilobtyes. One file only. Download from website below in a few seconds. Not zipped up. Run immediately.

Hey Pat, according to Chuck Dachis, the ultimate authority on all things Hallicrafters, there were 4 versions of the SX-100, these include the following: the SX-100, SX-100 Mk1, SX-100 Mk 1A, and the SX-100 Mk2. His book lists no "2A" version of this fine receiver, but this is not to say that it does not exist, and that it is not fairly common. Hallicrafters was the worlds worst when it came to giving a radio a new designation, simply because they made a minor cosmetic change, or, changed the value of an insignificant part. This is the case with the SX-100. The only difference between the "father" and its "children" are minor cosmetic differences,(i.e. slightly different knobs on the later models), and very minor value changes on electrical parts. The receivers were made from 1956 to 1961, and sold for the, then, princely sum of $295.00. I hope that this has helped to shed a little light on the subject for you, and good luck with the restoration! Thanks,

4625. R-390A Meters With Radium Dials- Need Procedure for Destruction/Disposal

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-29 05:37:46 UTC
From: The_AntiArt <The_AntiArt@Hoax.Land>
Message-ID: <7BD280691084F28B.3518232B82354D41.7C799B92DB774F2C@lp.airnews.net>
Source record: 47219

I have seen a several posts recently that summarized the dangers associated with Radium based paint used in the dials of meter sets from R-390A radio receivers.

What is the proper and legal procedure destruction and/or disposal of these meter sets?

4626. Re: Hallicrafters SX-100 Question

>The receivers were made from 1956 to 1961, and sold for
>the, then, princely sum of $295.00.

I was lucky enough to find a very clean and aligned SX-100 at an IL hamfest a few years ago for only $125 (I actually asked the OM selling it what was wrong with it at that price). Well, the BFO knob is stuck, but ISTR it was OK when I bought it.

Mine has no mention of 11 meters, but the 10m bandspread is calibrated down to just below 27 MC. The BC band has the two CD triangles, and the 160m band is shown as three legal subbands, back when LORAN kept us off parts of it.

In some ways this is the "poor man's SX-88" -- gear driven tuning, good selectivity controls, very sensitive. In fact, mine sounds like it is trying too hard to be sensitive, which sounds silly but if you've heard radios like tht you can maybe relate.

Also impressive is that the relatively small cabinet is filled to the brim with parts, not just a flat chassis with a lot of air space behind the dials.

Now, if it only had 6 main bands instead of 4, and push-pull output ... Mike K. AA1UK

I'm sure several of us will volunteer addresses to which these dangerous items
can be mailed for disposal. Most of these addresses are in the Callbook :-)

Hi folks.

I have a couple of 3-500Z (eimac) tubes I'd like to have tested. I believe one of them is bad, but I don't know which. It blew a glitch resistor in my power supply, but when I ohm them out they both look fine. Musta been an HV breakdown.

Anyway, if someone has the setup to test these tubes, I'd pay for your trouble. Even better, can you run a curve on them?

Let me know, and thanks.

WOW! Best thing to do is wrap those meters up in tin foil and mail to W7AX Meter Disposal Service. Mark the package: Attn: R390A Dept.....The sooner you do this the quicker the danger will be lessened at your location. PS: Will even cover the freight in order to get this matter under control as soon as possible.

Is this a troll? Well, in case it's not...

Don't know how many times I have to say this...
I have 15 years of radiological work.
The best thing to do is LEAVE THEM AS THEY ARE.
Don't throw them in a landfill.
Don't mail them to the Army.
Don't go buy lead-lined underwear for when you want to play radio.
Leave them in the radio and let them be radio meters.

THEY ARE HARMLESS IF LEFT UNOPENED.
THEY ARE HARMLESS ON YOUR DESK.
Repeat after me.... HARMLESS..... HARMLESSS......HARRRRRMMMMLESSSSS.
You could walk around with them in you pocket for the rest of
your natural life and they would not harm you... none, any at all.
You get orders of magnitude more radiation every time you
turn on your cell phone.
The only way you can get hurt is to break them open,
scrape the paint off and sprinkle it over your Post Toasties
or snort it up. So... don't.... do... that.

Thanks to the God-curse-them Hollywood media,
people are hysterical about anything marked "radiation."
Some people are beyond convincing.
Let me make this offer here and now:

If you have an R-390 meter, a TBY, a TBX, a Wireless Set #19,
or ANY OTHER mil radio under 70 pounds with radium paint
and you're afraid it's going to sterilize you or give you cancer,
I will pay cash money to have it packed and shipped to me.
I'll find a home for it.

73 Dave S.

I'm not sure what you are saying by this graphic or why you called me a "troll". I have never met you and was just asking a question. I do not appreciate being insulted.

Normally I have found Hams to be friendly and helpful in the past, but I suppose that generation has now gone.

To anyone else that reads this and is actually knowledgable on this topic, my concern is the potential liability associated with selling or giving away something that contains radioactive material.

If I sold someone a radio or some meters and their child accidently broke open a meter and was exposed to "Radium dust", I could be in for a big lawsuit. The best way to avoid this is to properly and legally dispose of the meters.

We live in a world where people will slap you with a lawsuit if you look at them the wrong way (claiming emotional trauma).

That radio you sell at a hamfest could someday cost you your house and retirement savings!

I understand that the meters are generally harmless if left
intact and I do not intend to destroy meters in the radios
I use, however I am concerned about selling receivers
with meters or individual meters that contain Radium.

We live in a much different world then the one I grew up in. Today if you sell someone a chain saw, and the fool manages to cut off his head with it, YOU will most likely be sued for negligence. (They will claim you did not inform him of the danger.)

If I sell or give someone a radio or some meters, and say their child breaks a meter open and is "exposed" to the "Radium dust", I could potentially face a big lawsuit.

That is why I am concerned.

P. S. I am not sure what you are referring to when you say "troll". Is this what Hams call people who are not Hams? Another responder actually called me a "troll" and I was quite offended. All I was doing here was asking what I consider to be a valid question.

A troll is an absurd post meant to give rise to many feverish flaming posts.
Radium emits alphas, betas and gammas (and neutrons when combined with
beryllium).
Cell phones may emit a fraction of a watt at a few hundred megahertz,
producing negligible heating, but no ionizing radiation is emitted and
therefore no interesting chemistry or physics occur. Frequencies of 22 GHz
are required before the lowest energy rotational transitions in water occur.
X-rays or more energetic photons are necessary for ionization.
The half life of radium is 1620 years. Radium produces radon gas. To
paraphrase previous posters and literally quote one of my profs: "Don't eat
it."
You want opinions on liability? Pay a lawyer.
H.

Hi,
The NC300 has a band switch mechanism which ran off a gear which
had a chain. The chain had loops on each end which took a string that
ran to two pulleys up to the band dial. As you switch the know the band

dial moved and the shaft the gear and chain was on switch other
components
to sync in the receiver to the band selected. My problem is the chain
is gone. I'm stuck on thinking of a way to get around this. Any
suggestions
on how to something in there to take the place of the chain?

Reasons to believe you're a Troll:
1. Your phony return email address The_AntiArt@Hoax.Land sounds rather like a Troll.
2. The fact that it was posted through Airnews.net (a premium Usenet service)
3. Most people that would do #1 and #2 above would know what (in Usenet speak)a troll is.
4. Raising up a topic that had been discussed recently in a way that would insure an emotional response. (aka. how can I destroy these highly sought after meters)

IOW - Looks like a Troll, Sounds like a Troll, smells like a Troll, it probably is a troll

> I had thought of applying 12 to 24 volts of AC to try to clear the
> contacts, but over here the mains supply is 240v.

I wouldn't be afraid to try the mains cautiously by simply using more current limiting to compensate (i.e., more lightbulbs or whatever is handy), and/or being judicious with runtime. All one really wishes to do, is to drive the reed into vigorous oscillation despite the oxidized contacts (assuming this is why it does not start), while having the AC voltage burn off the oxidation. Often, brand new but long-unused vibrators will oxidized in the same manner, and will not start. By way of clarification, pin #1 to us Yanks is the reed & the free end of the winding.

> The PSU has probably never been used, as there were two manufacturing
> faults inside a soldered up screening can - dead short circuits.

Do be extra wary of an unused PS of that era. Oddly (actually, quite sensibly if one thinks about it), used ones often will operate and will often still have many good parts, while one never used (such as a spare stored for 50 years) will more often than not have every single cap bad from aging. I have just rebuilt such a never-used military supply last evening, while another of the same year that has been not only used but abused, runs quite well as-is.

> This dud vibrator is the spare from inside the PSU, the main vibrator
> burst into life after a few seconds hesitation once the various faults
> were fixed.

Handy that you have a furnished spare. Any vibrator that will not start at less than 5.5 volts (if a 6-volt coil unit as most are) is definitely bad, and one ought to start at under 5 volts.

The hesitation you report is not good - it implies a period of contact-burning overload or troublesome starting.

> Yes, I will change the buffer capacitor, and the other waxed paper
> cardboard tubes.....etc.

> By the way, Ohms law I know, shade-tree mythology I have never heard of?

Cheifly a colonial affliction of us savages, but I have seen it in English & european shipyards as well<BG>.

Enjoy your project. :-)

4651. For Sale: Hallicrafters SX25

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-29 23:25:09 UTC
From: nc183d@aol.com
Message-ID: <20011129182509.19898.00000001@mb-md.aol.com>
Source record: 47144

Hi All,
I have a Hallicrafters SX25 for sale. 12 tubes, 4 bands covering .54 - 42 mHz. It has a 455 mHz I.F. 2 stages of RF amplification, ANL, BFO, crystal filter, calibrated bandspread for 10, 20, 40, & 80 meters and S meter. I had listed it last month and when I tested it out, it wasn't up to par. I have since had it gone over (replaced a few caps in the AVC circuit) and it now works very well on all bands as advertised. It is all original EXCEPT for a small jack that has been added above the tone control. It looks great, sounds great. I am asking $125.00 (firm) plus shipping from the 07860 zip code. I have a couple of photos for interested parties to see.
rgds,
Mark S.

Well I apologize for asking the question. I did not want to offend
you. I truly did not know what a "troll" was, but as you describe it,
I can not understand why anyone would want to do that.

I never in my wildest dreams thought that an inanimate object like a
meter would have evoked an "emotional response" in anyone.

I like older radios and recently saw some posts about Radium in
meters. This prompted me to consider the potential liability
associated with selling equipment containing Radium.

Why are these meters are "highly sought after" anyway?
I have never seen a bad meter in any of my R-390A radios.

P.S. I use Airnet because the news server of my ISP was crappy
and I download a lot of binary files (music, etc.).

I use an alias Email address because in the past spammers have
captured my real email addresses from news groups and
filled my mailbox with offers of pornography, etc.

If you read my original post, I did not want an opinion on liability.
I was asking how to properly and legally dispose of meters that
contain Radium. People then started calling me a "troll" for asking.

I mentioned the potential liability aspects because I wanted to avoid
selling equipment containing Radium to people why may actually
be dumb enough to eat it, and then sue me when they got sick!

Sorry for all the fuss it caused.

FS: Hammurlund SP-600 JX-31 VLF receiver

Classic VLF receiver for sale. Unit is in excellent shape physically. Has cabinet and original knobs. It has been stored a long time and needs cleaning and check up. Email me if you would like to see digital pictures of the receiver.

I'm just getting to the point now of cleaining it up, but don't really have time. I plan to sell or auction it once cleaned up but would be happy to sell it now for a big discount if you'd rather do the cleanup. This model has sold recently for as high as $2500 over the newsgroups and ebay. I'd be happy to sell it now for $1900 plus shipping from Southern California.

I did not send you an Email. I do not know who you are,
and did no know you existed until now.

Doctor.com looks like a health-related website. I was asking
a logistical question related to disposal of instrumentation
containing radioactive materials.

What you referred to as "things like this" was a valid
question that I asked in my original post.

I thought a news group was a place to ask questions
and hopefully have them answered by knowledgable
people.

(Not to be insulted for simply asking.)

You know, you've got a point.
Please forgive me if I sounded "snippy."
I thought one of the guys was having me on.

I would suggest selling or giving the meters away only
to a person who is willing to sign a release of liability.
A simple release/disclaimer form will cover you.

> P. S. I am not sure what you are referring to when you say
> "troll". Is this what Hams call people who are not Hams?..
No, not at all. On the internet, there are often people
who write something just to get several people to respond.
This is called "trolling." Some do it to aggravate, some
just as a joke- "Pulling your leg," if you will.
Since we had recently gone over this, I thought just maybe
someone was "pulling my leg." That, plus your user ID
"Hoax.land" leads some (including me) to think it
might have been a "troll."

In any event- If you have R-390 meters, many of us
will gladly sign a full waver of liability. There's nothing
like having "the real thing."
Kind Regards,
Dave S.

Now THAT was a troll.

4671. Radium Dials - A True Story

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-11-30 05:23:41 UTC
From: Mark Bell <bell@blazenet.net>
Message-ID: <u0e67f9cugm239@corp.supernews.com>
Source record: 47165

Hi Gang --

I was copying the mail about the R-390 Meters and thought I'd
share a somewhat off topic story, but since I know there are
fellow pilot critters amongst you, I figured you might enjoy it.

A few years ago I used to own a 1948 Cessna 170A -- beautiful
tail dragger, a fun plane to fly.

The original DG (directional gyro) was WWII vintage, and barely worked.
Since the plane initially had no working radios (the old coffee grinders
were
kaput, and not legal even if they weren't kaput....) and a barely working
compass, we had to keep the flights somewhat local based on knowledge of
the local area and the Mark-2 (in my case Mark-4) eyeball.

Well, as we progressed in our restoration of the aircraft, we decided to
see if we could get the old DG overhauled, as we wanted to keep the ship as
stock as possible. So I carefully boxed up the DG and sent it to an
avionics shop at Detroit Metro airport. About a week or so passes and the
box
(same one) comes back with said DG. No bill, no invoice, nothing. So, I
call the fellow up and asked him if he worked on the DG, and if so, was it
fixed, what'd I owe him etc.

Well....did I ever get an ear full! The fellow yelled at me and asked how
I dared to send him that "radioactive" unit!! Didn't I know that the
state environmental agency was snooping around the airport and that
he could've been shut down if they'd caught him with that thing, and
good bye to you.

Well, I just stared at the phone for a few moments and shook my head.
Kinda felt sorry for the fellow -- I hadn't a clue my ol' DG was so
dangerous!!

Well, we eventually upgraded to a rebuilt Sigma-Tek DG (worked fine),
and replaced the old coffee-grinders with a Rockwell VHF-251, and
replaced the old "dual rail-road track" compass with a new one....

...and the old DG and the compass now sit upon my shelf here at
home....

Send gyro and all the meters here, I will sign a full waver.
I need for ceiling night lights, as well as R-390 restoration
The Long Island Power Authority shut down the Shorum reactor and hasn't been feeding the squirrels in months.
The old Grumman employees doing the restoration at the Cradle of Aviation museum could use the gyro

My FT102 failed recently the fault is this:

Lots of drive, peaks up nicely on preselector
adjustable via drive control
No PA dip or load function via tune and load controls at all.
The aerial protection "bulb" lights on transmit.

Before I get going with my soldering iron and enthusiasm, just wanted to see
if this is a known fault
and what the fix is

Thanks
Tony G3ZRJ

Hi Lee,
I got an email from Jim, KK1W explaining the ball chain. I have an
online manual that is not sharp and thought the chain was chain for
a gear with teeth. ?? Never thought of a ball and did not see the
part that received the chain on the band switch when I looked in there
with a flashlight - well - till later and noticed the semi circles.
I thought I would never find such a small sprocket chain.
Mystery solved Thanks - David N1RBM

Lee W7AX wrote:

Thank you for your decent response. (Some people here
have been quite unkind.)

I never intended to rip the meters out of my radios and destroy
them. I am a rather far-looking person by nature and was simply
considering the legal ramifications of selling equipment
containing Radium.

I love my old radios and have no intention of selling them
any time soon. Besides, if we ever had a nuclear war or
someone popped off an EMP weapon, they would probably
be the only radios that still worked! :^)

P. S. I use the alias to keep my real Email address from
being snatched by spammers.

Thanks for your response.

I looked up that web site..... $89 for a meter..... $45 for a
ballast tube..... $125 for a power supply???

Un-freaken-believable!!

If anyone would actually pay those kinds of prices, I
would love to get the mailing list of their customers.
There's lots of junk....err "valuable" stuff I could sell them! :^)

(I purchased my R-390As quite a few years ago, but the most
I ever paid for a complete and working radio was about $250.)

Can somebody steer me to an explanation of e.g. the following code on a molded mica cap: CM35E 103 JO3. I know the 103 part is the capacitance; mostly I want to know the voltage rating. I have this vague idea it's the 'E' part... Anyway, I had a printout of this stuff once but can't find it, so any help greatly appreciated. Thanks.

73,
Mike, KK6GM

According to my old Allied Electronics Data Handbook you have
CM35 - lead mounting, molded case, mica dielectric
E - Temp. coefficient parts/million/Celsius = -20 to +100 with
capacitance drift of +/- (0.1% +0.1 pf)
103 - value = 10000pf
J - capacitance tolerance = +/- 5%
O - Operating temperature range = -55C to +150C
3 - Vibration grade = 10 to 2,000 cps

There is a note in the chart indicating that the voltage rating was
not indicated on earlier production caps. If it had been present it
would have appeared as another cap letter after the E.

I'm reasonably confident in this info, but I have seen other charts
that have differed in some cases. This is the best that I can do.

FWIW, I would toss the cap in favor of something less likely to cause
problems. Mica caps of that era DO go bad.
Ken K4XL - Replace "invalid" with "net" to reply.

No, they are usually autotransformers--single tapped winding--and thus you
will have no isolation from the power lines!

You can use two filamament transformers, of sufficient current capacity,
back to back to provide both your filament and B+ needs.

Try this web site:
http://zeus.cedcc.psu.edu/caps/mica_eia.html
It suggests that particular one is 300V: the J is 5% and the 03
should be voltage rating. (Google searches are wonderful...found that
one in just a few seconds. I used to have a cheat-sheet on them
too... ;-))

Cheers,
Tom

Does your community's recycling station have set days where they
will accept hazardous waste? They should accept the radium meters
along with smoke detectors (which use a radioactive isotope) for
proper disposal.

One thing you might check is whether the bandswitch shaft has slipped at the coupling between the switch wafers for the driver/pre-selector and the wafers in the pi-tank, so that the plate tuning/loading is no longer in step with the driver/pre-selector. Happened on my FT-102 once, with similar symptoms to the ones you describe.

http://www.nostalgiaair.org/NostalgiaAir/Riders/showinfo.asp?PATH=RME&IMG=_RME_12-8.gif

Play around with that page number of 12-8. There's info at 12-10,
12-11, 12-12 and at 11-12, 11-13, 11-14. 11-13 is the schematic but its
hardly readable...maybe somebody can provide some better scans?

I have for sale a very nice condition R-392 receiver.
Manufactured by Stewart-Warner.
No Cables, Power Supply or manual.
Just a very nice condition, functioning receiver.

$175.00 plus Shipping from zip 76015.

Thanks!

4727. Eldico/REL Station console.

Station console, part of the S 119 REL / ELDICO Communication System.
Similar to Collins look alike gear from 1960's. M-135 is the console unit,
combination standing wave radio bridge, phone patch, ac power control and rf
output indicator. Needs 3 knobs and some cleaning. Working unit with manual
included. $ 75 plus shipping.

4728. Desktop rack cabinets

Message-ID: <mocO7.121214$HA6.17448419@typhoon.southeast.rr.com>
Source record: 47123

I have 2 heavy duty desk top type cabinets, with rack rails in front and rear. These are about 12-14" tall and offer about a foot of mounting space. I will provide exact dimensions if necessary. These are the 24.5" deep versions and can hold boat anchor type receivers and transmitters just fine.

They are heavy steel, but shipping shouldn't be too bad. They are located near Raleigh, NC right now.

Picture available by email.

I'm looking for 6M and HF equipment and accessories, and would prefer to trade, but will discuss selling outright.

Will,

As others have mentioned, you need to check if you have a real
transformer or an autotransformer. One isolation transformer I have
used for such applications is the Triad N-68X, which is a 120 to
120/240, 50 VA unit. It's a pretty easy transformer to find.

As far as using a dual-primary filament transformer, FWIW I've heard
some people recommend against this because there is very little
isolation between the two primaries. Anybody want to comment?

From: TooManyTubes <kb8tl@yahoo.com>
Message-ID: <u0ild7bqj0aqbf@corp.supernews.com>
Source record: 47124

I'm in the process of resurecting a Hallicrafters SX-42 and one thing that it is missing from the radio is the cover over the variable caps. Does anyone have a photograph of a proper cover they could share? I'm guessing the missing cover is not just a flat piece of sheet metal. I'll probably just fabricate something maybe with perforated metal. Some pictures of the beasty are at http://raq64.webpg.net/~p15218/SX-42/ of the radio when I got it and in it's now working but not finished state.

Thanks
Bob

I just picked up an SX-42, and of the three I own it is the only one
I have ever seen with the cap cover. I don't have a digital camera
at this time, but I could share a picture after Xmas (expecting one
for a gift!). If no one answers you, drop me an email and I will
either trace it or photograph it for you in a few weeks.

It is a simple metal plate and I think the Hallicrafters name is
embossed on it.

4734. B&W 51SB-B Alignment Help Needed

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-02 03:23:11 UTC
From: Mark Bell <bell@blazenet.net>
Message-ID: <u0j7tl2fa29b2a@corp.supernews.com>
Source record: 47128

Folks --

I'm at my limits at trying to align my 51SB-B, and need some help!!

Following the procedure in the manual (page 24), I can minimize the ripple just great for either of the sidebands, but when I try to find a compromise setting to minimize the ripple for both, the waveform for either looks pretty ugly!

The waveform looks like a really dirty and distorted sine wave.

I'm using a nice Leader Function Generator and Tektronix scope from work, and both are in cal.

Most of my ham "career" has been with CW, so I'll be the first to admit I don't know a lot about SSB, except what I've been studying in the ARRL handbooks. I'm not even sure of the question to ask!

I need some help / advice! Also, If there's anyone around the Philly / Baltimore are, I'd be happy to bring the unit down to get some help.

Thanks

Mark K3ZX

Source record: 47129

Hi Mark,

One thing to check is to see if you have got most of the hum out of the audio and power supplies. It doesn't take much hum to mess up your scope picture when trying to null the side bands. There will always be some though.

I have used an audio generator and scope to do those type of alignments but I find it easier to just use a receiver with selectable side bands and talk into the mike. Listen on the opposite side band from the one that you are trying to align. It is much easier to do that way as the hum does not throw you off. You can also get a good idea of how much side band suppression you have with the receiver too. Switch back and forth from upper to lower on the receiver. This will let you know if you are in the ball park. Be sure not to overload the receiver and also not overload the transmitter when doing the alignment or you won't be able to tell when you are getting a null. Keep the transmitter power down so it does not flat top and cause distortion. The distortion will be heard on the unwanted side band and it will appear that you are not getting the suppression you really have.

Source record: 47133

Recently purchased a cheap and broken Kenwood TR-2400 at swapmeet. Thought I would fix it up for a loaner to newcomers.

However, the service manual copies are more than the price of the radio.

Does anyone know where there is at least a schematic I can download or pay for a copy for. That might be sufficient. Have searched the usual places for free schematics or service info and found nothing.

Thanks for the help. Reply to k7fm@teleport.com

Do you still have the receiver? I may be interested.

Does it have the etched front panel or the silk screened panel?
Have you used it and do you know if all the ranges work.
Does it have the meter and all the knobs. Any mods or extra holes?

Thanks

George

Hi all!

Selling a lot of stuff here to make room for some new stuff. All prices shipped CONUS unless specified otherwise. Shipping is UPS insured 1 day after funds received.. All items in NW burbs of Chicago.

Icom 706MkII
I bought this new about 3 years ago.works great. never been in for repairs.hand mic,manual and original box $680

Hallicrafters SR-150 w/PS-150-120
looks and works good. output a little low manual copy $275

Heath SB-101 w/HP-23/SB-600
looks and works good $275

Heath HD-1418 audio filter
works and looks good $55

Vomax 4-D
works and looks good- have copy of manual $65

Heath Apache
DOES NOT WORK!
lights up but no grid drive. some internal mods -cab and panel fair
pick-up only near Chicago $100

Shure 55 mic
...mult impedances. looks fair. heil cartridge in it now but will include original pieces $75

Pro-26 handheld scanner.
I bought this new spring of 95. nice radio
$225

VX-5R
handheld... manual,orig box, a couple of extra antennas
$220

D-104 amplified mic
$40 or will throw in for $25 with the SB-101 or SR-150

Will consider trades +/- a few bucks for a ICOM-746, a Johnson Valiant or a Drake TR-4C or CW

Thanks for reading

I am looking for a R-390A receiver in good condition and playing order. Please let me know if you have one for sale and for how much.

Thanks

4752. WANTED: Amp for 160-meters

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-02 23:37:29 UTC
From: davearea51@aol.com
Message-ID: <20011202183729.16875.00000367@mb-fh.aol.com>
Source record: 47046

NOTE: IF YOU HAVE PREVIOUSLY REPLIED TO THIS, PLEASE DO SO AGAIN, AS AOL IS, ONCE AGAIN, PLAYING GAMES WITH MY "READ" EMAILS.

Amplifier or RF deck I can dedicate to 160-meters. Need not have the power supply, but if it does, so much the better. I am a home brewer, so have no deed for the Alphas, AL-XXXX's, Clipperton's, and the like. If it needs "fixing", so much the better! I need a winter project. MUST also have adequate dissipation to operate AM with reserve (4 X 572B's don't!). Please reply by email to either: DaveArea51@aol.com or W0LEV@ARRL.net

Thanks for reading.

Dave - W0LEV

FA: Extremely nice Hammarlund HQ-170 Amateur Band Receiver with the matching large Hammarlund S-200 Speaker. Includes original boxes for both the receiver and the speaker, and the original manual. This receiver's performance is excellent on all bands, and is a one-owner receiver from the estate of a Amateur Radio operator. There are no known modifications, and the receiver is extremely clean. It is sensitive, in calibration, and you will not need to do any "capacitor replacement", "alignment", etc. - it is a "Plug and play" receiver. No clock, but replacements are available if you want the matching analog clock. You'll have a hard time finding a nicer HQ-170 than this one! Thanks for looking.

As was noted by another lister, check the power supply ripple, then replace the balanced modulator diodes. You'll probably find it will balance out much better. (carrier that is) This will result in much cleaner audio.

From: David Stinson <arc5@ix.netcom.com>
Message-ID: <3C0B0E3E.D370B2A6@ix.netcom.com>
Source record: 47059

For Sale;
Heathkit SB-401 Transmitter.
Photos posted to alt.binaries.pictures.radio.

NOT "mint." NOT "collector."
I'd call it good/average with a normal accumulation
of dust/crud. Paint is 95% plus.
Photos available on request if you don't get the binary newsgroups.

I've tuned it up on 40 meters and it worked fine on CW and SSB.
Don't remember how much power it got out. I was using a
VHF meter so it wouldn't have been accurate, anyway.
I ran it a good, long time so the power supply filters
appear to be OK.
The 1st crystal oscillator isn't working on some of the other bands.
It's been months since I tested it and don't remember which, so
I'm only claiming 40 as OK. I'm told by Heathkit people that some
resistors in the 1st osc. drift and that causes the problem.
Should be an easy fix if you have the book.
I cleaned the pots, switches and etc., loaded it up on 40 meters
and made a contact. That's all the time I have for it.
Good winter project as the rest of the radio seems fine.
$100 plus shipping from 75087, or an interesting military trade.
Will be shipped with insurance/tracking/delivery confirmation.
Will give 3 day inspection. Offer refund less shipping if returned
in the condition in which it was shipped.

Chris, replace the bias cap in the power supply, it should be about 15 mf @ 150V ..if it is defective it will allow a ripple on the tube grids,causing the tubes to modulate the ripple (hum).check bias diode also..enjoy the T4XB..

I went out to the shop to take a photo of mine, but guess what -- I never put it back when I finished restoring my set, which I guess explains where all those covers go. If I find it somewhere, I'll make a photo.

Meanwhile, I believe it is just a flat plate. The SX-28 cover had a few ventilating slots, but on that set the tuner is completely enclosed in a metal box, which is not true for the SX-42. Perforated metal would be my last choice -- you want to keep dust out of the tuning capacitor.

Phil

Rare, all the CB'rs in 70 had them in both white and black face.
I must have replaced 100 meter zero pots for customers wen I worked for
someone in NYC
The Tempo One had the solid state plug in balanced modulator in place of the
7360 tube
(same set)
What happened to the VFO switch and knob

My memory from when I had one (memory and SX42) is that the plate had holes
for the tunning adjustments.

Not mine.

I even made a long adjustment tool that would reach through the cabinet slots so
I could null the carrier with the steel case in place.

No holes. Flat aluminum plate supported by the metal standoffs.
Had a quarter inch or so 90 degree lip around each of the four
edges. Easily made with a metal brake and shear.

==========

I just looked at my SX-42. The tuning capacitor cover is just a rectangular steel plate with a 1/4-inch lip turned down all around the edges. I have seen photos of covers with the Hallicrafters "circle-h" logo that Pete mentioned, but my cover doesn't have the logo nor does the several others I have seen. The cover measures about 8-7/8" X 11-3/4" as near as I can measure.

Best Regards,

Ed

4805. FS? Collins Factory ART-13 book (copy)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-04 01:41:13 UTC
From: "D. S. Platt" <jeepp@erols.com>
Message-ID: <3C0C29B9.439C0D3B@erols.com>
Source record: 46999

I have just obtained a really excellent original of the Collins factory manual for the ATC/ART-13 (not the "A" model). It is infinitely more detailed than the military manuals and shows some accessories I didn't know existed. The schematics are also very very good. Unlike my ART-13A original manual, one doesn't need an electron microscope to read it!! There's a lot more detailed photos and diagrams for alignment and repair, too. There's a whole section on rebuilding/repairing the relays and motors (whoopee!!) and a far better dissertation on the autotune system.

The type of binding it had lent itself to be taken apart (albeit carefully), so now I can make all copies directly via the original, not a second-generation. It appears that I can get copies, done on 3-hole punched paper, for about $14 a copy, including the 11"x17", single-sheet fold-outs. If anyone is interested, please let me know, this week, so I can have a run made. I'll let everyone interested know what the final price (plus postage/method of your choice) actually will be and you can make your commitment to purchase at that time.

Whoops, that is a mistake. I did mean transistors, not transformers. I just got a few transformers for some hobbies, so that was on my mind yesterday as well :) As for the brands of the transistors, they are all Western Electric actually, but other than that, I don't know anything really at all.

In this case, "Modulation" is the method of putting audio
intelligence on the carrier wave. When you simply turn the
transmitter carrier on and off with something like say, a key, you have
a CW transmitter. If you know the code, you can send messages back and
forth using morse code which is commonly refereed to as CW. (CW stands
for continuous wave.)
If you would like to send Audio using a microphone for instance, you
can close the key so that the transmitter puts out a continuous wave or
signal. Then you can use two common methods to put audio on that
carrier. First, you can use a "modulator" that takes the audio and
varies the output or power level (amplitude) of that carrier wave in
time with the audio vibrations picked up by the microphone. Viola! AM
or amplitude modulation.
Or.....instead of modulating the signal level, you can instead
modulate the frequency generating oscillator and move the frequency of
that carrier signal back and forth in time with the audio vibrations.
You are in effect moving or" modulating" the frequency +/- while the
carrier level remains constant. Yep! you guessed it. Frequency
Modulation (FM).
One of the advantages of FM is that most noise like lightening,
ignition noise, power line static, etc., is AM in nature. That is why
an FM receiver does not hear this kind of noise while an AM receiver is
useless during a lightening storm or it there is a bad line insulator in
the neighborhood. It does take up a lot of spectrum though and is not
good in weak signal applications like DXing. That is also why FM is
relegated to the upper frequencies where there is more room to spread
out and signals are generally strong and generally line-of-sight.
Hope that helps clear things up a little.

4818. Rare NATIONAL receiver FS (27 tubes)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-04 18:21:57 UTC
From: radioman390@cs.com
Message-ID: <20011204132157.12884.00000441@mb-de.news.cs.com>
Source record: 47012

A superb receiver, utilizing 27 tubes (mostly Nuvistors) providing coverage 2-32 MHz. Triple conversion (1625-1725 kHz, 220 kHz, and 65 kHz). Seems to have a gold plated tuning capacitor, but I make no represenation about that. Uses Veeder-Root counters for freq readout (like R-390). Two meters, signal strength and 100 kHz level.
The output is at 65 kHz (no audio section) as signal went to Direction Finder electronics. Spook stuff. Also no power supply (needs 175 VDC, 5 volts for lights, 6.3 volts for filaments, 18 volts for the regulator and 115 violts. Also needs 1 kHz reference.

Currently shown in Fair Radio catalog as R-1125/R-1230 COUNTERMEASURES receiver, which it ain't. It is one over several receivers used together in a RDF setup.

I originally got it to use with a Hammarlund HC-10, where I was going to feed the output to the 60 kHz stages. But you could feed the IF out to any VLF receiver capable of 65 kHz reception.

Once ambitious, I'm no longer interested in building a Power Supply, or a detector/audio circuit. 19" wide and 6.2 inches high, and 25" deep. Weighs 70 lbs. Top quality components and workmanship. Probably the best-made National receiver I've ever seen. Makes the HRO-60 look like a tin can. Not quite as interesting as the HRO-600 I had, but better construction, by far.

$150 + ship (Fair gets $195)(Pickup on LI)

4819. Rohde & Schwarz receiver multicouplers 1-to-8

Owing to paper type of original manual (glossy and heavy), I've been told that the job will require hand-feeding (sic) the digital copier. This serves to, at least, triple the cost to copy. For this reason, I'm canceling the offer until I can get the issue resolved. I'll keep the group informed.

And... thanks for all the inquiries!!

4824. RANGER I VFO problem....HELP

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-04 21:23:23 UTC
From: jtyburczy@aol.com
Message-ID: <20011204162323.01564.00000177@mb-mb.aol.com>
Source record: 47018

This is the 3rd time I have been in my Ranger I VFO trying to cure a recurrent instability problem.

Operation with crystal control is perfect. The problem is the VFO. It is unstable after warmup. This is not a slow drift, it's erratic JUMPS of many Hz. The condition seems temperature-related. When monitored thru a receiver w/BFO you can hear the signal begin to "warble" shortly after the transmitter warms up. It also appears mechanically-related at this point. I can tap on the VFO case and make the signal warble. And it often goes off warbling on its own, no tapping needed. Sometimes it settles down after an hour or two.

I have long ago swapped out R3 for a higher wattage unit, and replaced the OA2.

I have done the lithium grease thing, squirting small amounts in the variable cap bearings (both the main VFO cap and the trimmers).

I have tightened down the hardware on the caps. I have painstakingly secured all VFO box sheilding with new screws and lockwashers. I have grounded the VFO box to the chassis.

All tubular micas in the VFO have been replaced with Silver Micas. Ceramic discs have been replaced with Orange Drops. This leaves only the four flat micas on top of the board, C12, C13, C14, and C15. They have not been replaced....yet.

I am at wits end. Can anyone suggest what might be the problem, and how I can cure it -- once and for all?

Since I don't check all these forums regularly, email reply would be best.

jtyburczy@aol.com

Thanks in advance and 73, Joe, W1GFH/6

I've seen things like that happen when the tube pins are not
making good contact with the tube socket. Also, cold solder
joints could do it......

Good luck.

Actually, narrow band FM with low modulation index (like .6 or so)
is indistinguishable from AM on a spectrum analyzer. It is easier and
cheaper to modulate using FM since the modulation can be applied
to the oscillator (for instance) and the stages between the
oscillator and the antenna don't have to be linear.

No big modulators or audio power amplifiers are required. And
an FM transmitter lineup is much easier to build and keep stable
than an AM output stage, which has to work, without instability,
at B+ voltages between zero and twice the CW value....

The use of AM on the lower bands, and in the aircraft bands (108-136 Mhz) is more of a matter of history than design optimization.

Wide band FM has some advantages in S/N ratio when the signal is at the threshold of detection. But it takes up too much spectrum for hams to use, since the bands are already crowded..... AM envelope detectors are poor at low SNRs. Product detectors (synchronous AM, for instance) work just fine, but need to be synchronized well for AM..... not much of a problem anymore, but in the past (40 yrs ago, when I started in this hobby) it was tricky. SSB, by the way, is amplitude modulation..... which is why the amplifier chains need to be LINEAR........

SSB FM never really caught on, but seemed like a good idea...

Just my two cents worth.

Andy in Dallas w4oah

Just to confuse things a little more,, the carrier of an AM signal does not change in amplitude with modulation. The carrier of an FM signal does change in amplitude with modulation. Having said that, CW is a form of amplitude modulation. It is conveying information by changing the amplitude of the signal.

Someone mentioned earlier that AM and FM were both forms of RF modulation. That is how it is generally thought of but not necessarily true. It does not have to be an RF signal that gets modulated. You can modulate an audio frequency with another audio frequency also. Example would be a swept audio oscillator.

FM generally has better noise suppression than AM but AM has the advantage when signals are week. Even in the presence of noise..

Forwarded announcement:

Merchant Marine Highlighted in D-Day Museum Activities in New Orleans The vital role of the American merchant marine during World War II will be highlighted in New Orleans this week during events marking the first major expansion of the National D-Day Museum. Merchant marine veterans will participate in a parade and other events honoring the men and women who fought for victory during World War II. In addition, a modern cargo ship, which stands at ready to support today's armed forces will be open for tours. Maintained by the U.S. Department of Transportation's Maritime Administration, the Ready Reserve Force ship CAPE KENNEDY, like its World War II predecessors, is crewed by merchant mariners. The bands of the U.S. Merchant Marine Academy and the State University of New York Maritime Academy will participate in the December 7 parade in downtown New Orleans. During World War II, 733 American merchant ships were lost under enemy fire taking with them more than 6,000 U.S. merchant seamen. Included were 142 midshipmen of the U.S. Merchant Marine Academy. More information about the merchant marine during World War II is available at the Maritime Administration's Office of Congressional and Public Affairs, (202) 366-5807, or on its web site at http://www.marad.dot.gov/Education/history/ww2.html. Activities involving the merchant marine, Maritime Administration, and maritime organizations, include: Wednesday, December 5, 9:30 a.m.Ready Reserve Force ship CAPE KENNEDY departs Poland Ave. Wharf under tow to Erato Street Wharf; trip will take approx. 3 hours. Media wishing to travel with the ship should make arrangements in advance (see above contact numbers). Thursday, December 6, 11:30 a.m.Maritime industry luncheon onboard the CAPE KENNEDY, observing the 25th anniversary of the Maritime Administration's Ready Reserve Force. Open to media.

Thursday, December 6, 7:00 p.m.Presentation of builder's plaque from World War II Liberty Ship WILLIAM ELLERY to the National D-Day Museum during reception at museum. Friday, December 7, 10:00 a.m.Participating in the Pacific Victory Parade will be: • Merchant marine veterans of World War II • The U.S. Merchant Marine Academy Color Guard and Band • The State University of New York Maritime Academy Band Friday, December 7, 12:00 noon - 5:00 p.m. Saturday, December 8, 12:00 noon - 5:00 p.m.Ready Reserve Force ship CAPE KENNEDY open for tours, Erato Street Wharf Friday, December 7, 12:00 noon - 8:00 p.m. Saturday, December 8, 10:00 a.m. - 5:00 p.m.Exhibits at the Gathering of Eagles in the Convention Center include: • The Role of the Merchant Marine in World War II • A Salute to African Americans in the Merchant Marine and Maritime Service • About the U.S. Merchant Marine Academy Saturday, December 8, 10:30 a.m.Concert by the State University of New York Maritime Academy Band, Gathering of Eagles,

Convention Center

Did the wives and children of merchant seamen, whose graves are at the bottom of the North Atlantic, get pensions like their armed-services comrades. Or were American seamen treated by the shipping companies as civilians who just did not turn up to collect their pay at the end of the voyage ?

Between the years 1939 - 45 there were more than 100,000 British merchant seamen who did not turn up to collect their pay at the end of their last voyages. And that was the end of the matter.

Source record: 46952

I had a Hammerlund HK-1B in the 1970's

The battery is 22 volt, which takes up 1/2 of the inside cabinet (and
weight)
They are still available from some battery stores and mail order

Should be 2 spade lugs (red and black inside). Red goes to positive
terminal, black to the negative
on the battery.

Fairly simple transistor circuit with 2 relays.

Some people wire two 9 volt batteries in series, but battery life is usually
shorter than the 22 volt battery.

I've put a Collins CP-1 crystal up for auction at Ebay. It belonged to
my father (K0HPA/W3KEG). It's at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1306349092

Thanks,
Ben Harding

4867. WTD Meter and knobs for SX96

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-06 00:00:16 UTC
From: Mike Sanders <k0az@sofnet.com>
Message-ID: <u0td8som8eub48@corp.supernews.com>
Source record: 46961

Greetings, I am looking for a meter with clear plastic for SX96, 99, or 100.
Or just the plastic for one of these meters in good clear condition.
Also, looking for main and bandspread tuning knobs for these receivers.
Thanks, Mike K0AZ

4868. Regulated vs Switched power supplies

Newsgroup: rec.radio.amateur.boatanchors

I ask this here because I know from reading your posts that this is
where the experts hangout.

I'm a new General getting into HF and need to buy a 12 VDC power supply.
I've seen regulated (cheap) and switched (expensive).

What's the difference and why should I spring for the more expensive
switched (or should I?)

Thanks guys!

4869. Re: HQ-145A vs. HQ-160 or HQ-150

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-06 00:33:33 UTC
From: Bob Laird <xlaird@earthlink.net>
Message-ID: <3C0EBD34.DB9D92CE@earthlink.net>
Source record: 46962

Since I posted my original question about the three rcvrs, I've acquired an HQ-145A.

According to the manual reproduced on the(sadly missed) Hammarlund Historian site, the -A was designed to receive SSB at full rf gain, using a "separate SSB/CW detector". When I select SSB/CW, the BFO won't run, until first switching off the AVC. Nonetheless, there is a good AVC effect on SSB/CW, for all but the strongest signals, which need the RF gain backed off a bit. The 'S' meter doesn't work on SSB/CW.

The 145-A is unique in that it has a phased crystal filter, with a good CW peak, plus a tunable i.f. notch. Nice system for receiving CW, and overall slightly better 'single signal' sideband selection than my HQ-160, with the Q-multiplier peak/i.f. notch combination.

All things considered, I'll probably sell the -145A and get a -180 or -180A. The 180-A has separate xtal-controlled upper and lower sideband offsets, as well as a solid state rectifier, and a 'constant-on' filament voltage on the h.f. osc. for less warm-up drift. Anybody know if the -A stability is really that much better? I'd actually prefer the tube rectification.

I am about to take an overseas posting and have to shift the following, pick up in Suffolk or I can drive to you if you want the lot.

1. Collins 75A4 with after market 2.1 and 500 Hz filters and original 3 KHz filter. £500
2. GPR 90 TMC general coverage and amatuer bandspread receiver £450
3. Drake R4C with Sherwood (done by Bob Sherwood) and Drake shop mods (All) and all filters £450
4. Drake T4XB with AC4 and MS4 (new valves 180w output all bands with 160m xtals) £350
5. National HRO50T1 with coils for all amatuer bandspread (80-10m) and 1-2 MHz £200
6. Everything you ever wanted for the HRO 5 Coils, Coils, more Coils and three radios in various states of assembly and two PSU's £150 or free with one of the above
7. Johnson Viking Ranger II, full output 160-6m AM/CW, VGC £100
8. D104 with Drake mic plug

£75 or free with item #4
9. Drake TR4 and RV4 (w/o case) £125
10. Drake R4B £100

email if interested.

Bob... I have a 180AC.
I shut it off using the AC power strip.
I rather let it drift a bit than leave those tubes on forever. I do the same thing with other rigs that have those always on filaments.
In any event, if you DO leave them on, the drift on power on is nil. As in cannot notice it.
Regards...Dave

Source record: 46978
Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.boatanchors

Inexpensive replacement pilot lamps or lamps for
your projects in many different colors are available
at your nearest Wally World. They finally started selling
10-packs of replacement lamps for those strings of mini-christmas
lights. They come in 2.5, 3, 7 and 12 volt ratings and cost
a whopping 70 cents for a pack of 10. Just solder one of these
into the old base and away ya go. And they have blue ones that
should light up those Drake dials.

4885. FOR TRADE: WWII RU-19 SPARE CHEST W/CONTENTS

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-06 03:42:16 UTC
From: David Stinson <arc5@ix.netcom.com>
Message-ID: <3C0EE918.6C767D6C@ix.netcom.com>
Source record: 46979

TRADE:
Have: RU-19 WW-II Aircraft Receiver Spares Chest.
New-old-stock. Full contents. Beautiful.

WANT:
One of the following spares chests *with or without* contents.
In order of preference:
AN/ARC-5 (CBY issue only. Don't need CCT issue).
GF-11/RU-16
RU-16
TCS (-12 preferred as that matches my set).
SCR-183
SCR-274N
SCR-287
AN/ARC-8

Other WW-II era aircraft or infantry portable spares chests considered.

Conditions:
Must be in good shape, meaning- no major wood gouges or holes drilled to make it a toy box. I can fix minor dings and dents with a steam iron, but busted or peeled wood with axe marks...nah. No repaints that I have to strip. No missing separators or other missing pieces. Paint doesn't have to be perfect but does have to be 100% restorable.
Most important- Nomenclature printing or plate must be unmarred and fully
legible. Paper labels or printing inside- if not unmarred, at least legible and complete.
Minor defects OK- depends on what's "minor" ;-).

Photos may be requested and will be supplied on request.
If your box is heavier then mine, I'll even up the shipping costs with you.

> still there even with no mic in the tune mode.

Have you checked out the cabling to the T4XB? If there is a common ground lead between the HV and Fil, you will have an un-reduceable hum by the amount of the filament/B+ gnd lead IR drop. Run a separate filament gnd lead to the xmtr and gnd it at the xmtr only. You then will have separate gnds for B+ and Fil and eliminate this as a source of hum.

Source record: 46983

Hi, I just aquired a SWAN 260 HF rig which needs a new 6LQ6 final.
That's easy to replace but I need a schematic of the rig. I have one
but it doesn't match what I see in the circuit. In my rig, there is a
large resistor soldered directly between two pins of the final tube
socket. Also, the schematic doesn't agree with other details either.
These appear to be factory original, not user changes. Does anyone have
schematics or service manuals, etc. for this rig? Any help would be
greatly appreciated...tnx es 73...

A couple of years ago while I was living in Wells Branch
north of Austin, I sold an unassembled TA-33 beam to a ham.
I couldn't find the instructions.
I just found them and a steel plate that goes with the beam
in the bottom of a box.
I don't remember who bought the beam,
but I would like to send these items to him.
Please ask around at your club meetings and on the local repeaters.

Go to Google.com and do a search in rec.radio.amateur.equipment for switching power supplies. There was a very good explanation of the differences between heavy transformer supplies and the lightweight switching supplies. There are cheap and expensive versions of both kinds. You might look at a brand like Astron -- I believe their prices are considerably lower than the name brand supplies from the Ic-Yae-Kenw...

Look at mfj, too. One of their switching supplies, in a QST test, was a lot quieter, rfi-wise, than name-brand switchers.

If you get a switching supply, make sure it is well-suppressed in regard to rfi. The transformer designs don't have that problem.

Are you sure the DD6 is set up properly for the IF in YOUR radio? There were 2 different IFs produced in that model, and the DD6 has to do the proper math.

Is there a jumper or switch internal to the counter to switch the presets between 5520 and 5645? The DD6 is basically a frequency counter, but the actual counter chips are capable of being preset to accomodate the LO-VFO or LO+VFO difference, which depends on the band you are operating.

I believe the xtal time base should be set to make the "counter" read correctly, as opposed to the "frequency display"- technically, they are two different modes. By changing it, you are changing all of the timing gates for the counter chips, and they will divide by the wrong amount, making them non-linear. This will give the symptoms you are describing.

I have reduced the auction price of this interesting radio:

ANTIQUE POLYROYAL 5-TUBE RECEIVER, ca. 1920. "THE-GEM-OF-THE-AIR" Very clean condition (see photos). Some scratches on top cover, but wood case otherwise very sound. Inside is spotless. Obtained from estate of W1PXI (SK). Operational condition and other details not known, but schematic is included.

I had a similar problem with one of my Valiant I's. As I recall, I may have been able to cause some instability by directly tapping one or more of the affected caps. In my case, I found that I had to change out all the red, silver-mica caps on the top of the circuit board (using a good quality dipped micas). After that, no more jumps, squeaks, and instability. Could it have been purely mechanical and all that re-soldering did the trick? Maybe, but I think it was bad caps... Good luck with yours... de Jeep/K3HVG

Hi there,

Some of you might know me from the http://sonic.ucdavis.edu/siltronix
web page articles.

The 12 Cinch Jones plug (actually it's a jack and not a plug) AC Power
cord common to the Swan & Siltronix 1011 has been discontinued. I did the
homework and found a replacement source which required that I buy a large
first order min quanity.

So I'm making up a moderate amount of replacement power cords for sale. If
you'd to buy one, drop me a note direct by removing the NOSPAMPLEASE out
of the Email header above.

cheers
skipp

http://sonic.ucdavis.edu/siltronix the Swan Siltronix web page
http://sonic.ucdavis.edu has an Amateur Radio Page(s).

Special valves for sale:

The following valves are for sale. They are unused unless otherwise specified, and mostly in original boxes. They are all in stock and can be shipped immediately to anywhere in the world.

2 pcs 3069M Large, round CRT in super heavy duty packing material each in a wooden barrel. One in

completely ew, obviously never unpacked (only

by me for inspection), the other one seems also to be new and unused but it has been opened by someone. Price: US$ 150.- each

8 pcs F16-10LD CRT by GEC (some boxes says 'Haltron' on the outside. I have not opened to verify). They are obviously all unused.
Price: US$ 100.- each

1 pcs F16-10LD CRT as above, but made by Mullard.

Price: US$ 100.-

1 pcs F16-10LD CRT as above, but this one is used. It has a little spot on the screen. Price: US$ 50.-

4 pcs 7BP7 CRT. The boxes says 'Haltron' I have not looked inside. Unused and unopened.
Price: US$ 100.- each

5 pcs 5FP7 CRT. The boxes says 'Haltron'. Some are opened and some are sealed. All the valves are

obviously unused Price: US$ 50.- each

6 pcs P535/1E STC pulse modulator valve. Also coded CV 427. It is similar to 715C. All unused.
Price: US$ 50.- each

1 pcs P535/1E Same as above, but this one seems to be used.
Price: US$ 30.-

6 pcs C1148 EEV pulse modulator valve. Unused and in original boxes Price: US$ 50.- each

12 pcs C1150/1 EEV pulse modulator valve. Unused and in original boxes Price: US$ 50.- each

3 pcs C1166 EEV pulse modulator valve. Unused and in original
boxes. Price: US$ 50.- each

1 pcs QF 451 Ferranti. Looks like a radar TR switch and unused.
Price: US$ 20.-

1 pcs KS 9-40D Mullard klystron. Unused in sealed box Price: US$ 20.-

4 pcs M509 EEV magnetron. Also coded CV 3982. Unused in
sealed box Price: US$ 50.- each

2 pcs M599 EEV magnetron. Unused in sealed box
Price: US$ 50.- each

1 pcs JP 9-75 Mullard magnetron. Unused in sealed box
Price: US$ 50.-

7 pcs 24B1 STC trigatron valve. Unused in original box (Strange
looking valvel) Price: US$ 30.- each

11 pcs 725A Western Electric magnetron. Unused in sealed boxes.
Price: US$ 30.- each

E-mail me if interested. Offers are also welcome.

Date: 2001-12-07 21:48:55 UTC
From: "Peter J. Bertini" <commquart@home.com>
Message-ID: <bPaQ7.97791$Y6.10237286@news1.rdc1.ct.home.com>
Source record: 46916

You might want to ascertain their age, and whether they have more
value as collectables than as project parts. There are collectors
looking for similar items, but how rare those WE's are I don't know.
The first device looks quite early.

Pete

I'd like to thank the group for the education and their suggestions. I bought a very nice, reasonably priced MFJ Regulated power supply today. It's completely silent and produces *0* RFI across all bands

Thanks guys!

|Thank you.

First, the 8405 is a Vector Voltmeter, not a Vector Impedance Meter.

So if you have an 8405, AN-86 will not be of too much use to you. You want
AN-77-3. If you have a 4815 then AN-86 will be of use.

I have both of these notes. If you would have asked a couple of days ago I
could have made you a copy while I was at Kinkos making one for OZ9DR.

What's yer poison?

Hi David
These are words of wisdom by you

From: David Stinson (arc5@ix.netcom.com)
Subject: NEVER READ A "Re:" ON R.R.S.
Newsgroups: rec.radio.swap
Date: 1998/12/07

Some ten-cent advice for you.

Save youself some aggrivation--
If it starts with "Re:,"
it's either some old fart sour graping about prices
or a silly flame war.

If it starts with "Re:" just delete it.

The R7 is an overpriced engineering mistake, foisted on the Drake
lovers with promises of additional features (like a notch filter that
really sucks) and compatibility with the TR-7 (yeah, but they're NOT
phase locked together!).

Save your money, the TR-7 receiver is every bit as good as the R7.
All you'll gain with the R7 is more stuff taking up room on your desk.

Written by one who's had a perfect R7A and ditched it in disgust.

Source record: 46813

I need some advice from some of the more learned members of the the group: I have a Hickok 539a which is exhibiting the symptom of the #81 bulb glowing when I test a power tube, say a 6l6. When I turn the filament voltage down the bulb gets dimmer. When check 35l6 the bulb burns bright. I put fresh caps in and tested the tubes. No problems there. I checked the filament output and the numbers are about right. However, in the off position the still was voltage present is that normal? . Any Ideas? What should the resistance on the primaries be of the 2 transformers?

Message-ID: <ey5R7.995$vK1.89686@newsread2.prod.itd.earthlink.net>
Source record: 46821

I have for sale from an estate the nicest Heathkit SB-104 Station that I have seen. All gear was assembled by the owner's son who is great technician. His work is superb. The gear has not been used much and not at all in the past 15 years. All components and boards are original. Everything works fine except the digital readout on the SB104 flickers after it has been on for awhile. I think the gear needs some contacts and sockets cleaned.

1. SB-104 SSB Transceiver with SBM-104-1 Modification Kit installed;
2. SBA-1043 400 Hz CW Filter installed;
3. SBA-104-1 Noise Blanker installed;
4. SB-604 Accessory Speaker;
5. HP-1144 AC/13.8 Volt DC Power Supply;
6. SB-614 Station Monitor/CRT;
7. HD-1410 Electronic Keyer;
8. Heathkit Mic for SB-104. This is the later brown desk mic, modern design;
9. HD-15 Hybrid Phone Patch.

All equipment looks new and comes with original manuals. Gear will be double boxed and packed well at no cost.Price is $575 plus actual shipping costs from 79602 Thanks, Charlie Hugg, K5MBX

The key feature of an antenna tuner claimed to cover 160 meters is the inductance of the roller inductor.

What is it ? Alernatively, if inductance is not known, how many turns does it have?

Otherwise purchasers may be disappointed.

Joe, would the high low have an effect on the current draw even before the test button is pushed? The current is causing the bulb to light whenever a tube is put in a socket and the filament starts to heat.

Its actually an RF Power Components Maxi Tuner. It tunes my 55 foot sloper on 160 easily . I'll be glad to count the turns if someone wants me to. Id guess and say the roller is 28uh or better.

4990. Swan 500 Station

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-11 05:30:30 UTC
From: KU4YP <ku4yp@earthlink.net>

hello,

i have a swan 500 station for sale. it includes the following,

Swan 500 (not c) 80-10 meters. weak on 15 meters, about 50-60 watts. 100 watts+ on 10. 120 watts on 20, 200+ on 40 and 80. radio is clean and looks good. has one scratch (small) on top of radio and slightly rubbed on the front top corners. no extra holes or apparent mods.

Swan model 117xc power supply and speaker. has been modified (no holes) with two wires from speaker where i used a dsp 9 audio filter with it.

Swan 410 vfo. matches the 500 radio. very clean. no scratches or dents. works well

Swan model 22b vfo adapter for vfo.

Swan model vx-2 vox unit.

Sure 444 desk mike with Swan logo.

Swan model fs-2 field strength meter. clean. works. has original antenna, which is rare to find these days.

this rig is excess to my needs. this radio and all equipment is in service and operational, however due to it's age i must sell it as is. i have aquired a drake tr4c and have a couple of heath rigs so i must sell this to finance an amplifer.

if you want to see pictures, go to http://home.earthlink.net/~ku4yp and click on radios.

asking $400.00 for all the above and will SPLIT shipping to lower 48 states. i ship from mailboxes etc. because i am willing to pay more for something packaged well. email me to discuss shipping elsewhere. i would consider a trade for a CLEAN and OPERATIONAL heathkit sb220 amplifier.

thanks for reading,

mike prevatt

From: Nico van Dongen <nico.vandongen@compaq.com>
Message-ID: <c4kR7.396$BK1.7756@news.cpqcorp.net>
Source record: 46836

I have a working Wireless Set No11, Australian version. This is a WWII HF vehicle set CW, MCW and AM. One range 4.2 to 7.5 Mc
It comes with all cables, high and low power units, ATU, CW key, Mic and headset.

The set is in good condition but I had to replace the dynamotor in the high power unit because the old one fell apart. The tag on the high power unit actually reads low power unit. In the past someone changed the tag plate. The antenna current meter is defective but I have a good spare one of a different size, this meter can be put in the housing of the defective one.

Price US$ 750 excluding shipping cost.

I'm located in the Netherlands,

Nico PA3ESA

==========

Fred:

Make sure the #81 in your tester is really an 81. Folks often put other bulbs in the socket and if it is a lower current bulb, it will glow with only the heater load. BTW the #81 is a 6-volt tail light bulb and is rated at 1.02 Amps. Most 12-volt bulbs are rated at about half that current.

If your transformer has shorted turns, I would expect the #81 would glow without a tube in the "test socket."

Best Regards,

Ed

Ed,
Thanks for the advice. The bulb is in fact a #81 . How would I go about
checking for shorts in the windings. What sort of resistance should I expect
to see in both the primaries and secondaries?
Thanks,

5008. heath HW-101 repair help?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-11 18:55:39 UTC
From: dthomas@rt66.com
Message-ID: <ur8q1fuxg.fsf@rt66.com>
Source record: 46852

I have a Heathkit HW-101 with a couple of problems. It seems like it would be easy to fix.

First problem: even after warm-up, the VFO drifts up at a rate of about 1 Hz/second. It's truly obnoxious. I'm planning to put a little microcontroller-based VFO stabilizer in there someday, but in the meantime it seems like it should be possible to do better. The specs say 100 Hz/hour. Any hints for how to find and fix the problem?

Second problem: The transmitter oscillates on the 40M and 10M bands, but tunes up nice on the others. With an antenna it's worse but it exhibits the failure with a real 50 ohm dummy load. I figure it's some sort of parasitic oscillation (it makes little squeaky oscillation noises as I tune through it) and wonder if there is a bad ground or improper neutralization. I tightened screws and checked solder joints, but that didn't do anything. I tried to follow the neutralization procedure in the manual but I'm not sure I got it right. I can get the plate dip and power output peak to coincide on one band, but they'll be off on the other bands.

Any advice would be appreciated.

David

It sold for $1500 because someone chose to pay that for it. I personally have seen a couple others sell for that. I have one here that I have spent 2 years and several hundred bucks to fix and I wouldn't sell it for a lousy $1500.....but your comment does say at least one thing....most hams are the cheapest guys around. Unless a $1000 radio is selling for $100, the seller by your definition is a robber. I think the insanity part of your comment says it all.....about yourself.

Look for out-of-tolerance components, especially capacitors,
but resistors also. Resistors apparently change value upwards,
while capacitors tend to get leakier. Electrolytics are the
worst, and if the rig has been sitting unpowered for years, it
will be best just to replace them -- if you can find replacements.

I have a mod 533 tester and the lamp will glow when a tube with relatively high filament current draw is set up. It always has. And ,yes I have a genuine # 81 bulb in the tester. Look at the watts being used by the filaments and translate that back to line current draw. I suspect it will be enough to make the bulb glow at least dimly.

Most of the RF instability problems in the Heath SB and Hw rigs come from bad grounds on the shields under the chassis. You may have to remove them and clean the spots where they make contact to the chassis and each other. The screws need to be very tight that hold them down. Also the final cage shield if not ground well at all places where there are screws can cause problems. Don't forget to clean the spring contacts that ground the band switch shaft at several points. Sometimes all those grounds can be a job to get right.

Want your first little old 80 - 6 CW/AM tube rig back? Cosmetically very nice except small paint scratch on top & one chipped knob. New filter caps, both black-beauty paper caps also replaced, brand new final, still-good old final as spare, all tested & burned-in (dummy) all bands/modes & working fine. Small, neat jack mod at rear for more convenient VFO connection, and added line fuse under chassis to protect xfmr. Original manual. B/O+ship.

The crummy designed VFO in the HW-101 is a lost cause, stresses keep it constantly unstable.
The drive coupling was also done lousy
You will notice lightly pushing on the front panel also send's the VFO jumping.
Try experimenting with the 2 56PF caps substituting with both NPO and N coefficient's to get some form of temp compensation.
Buy big bottle of aspirin and plan on spending hours

>Second problem: The transmitter oscillates on the 40M and 10M bands,
>but tunes up nice on the others.
Ground the tube shield of the 6CL6 driver tube with silver solder and braid to the chassis, check connections on the comb bracket.
Heath screwed up and made some kits with aluminum brackets the couldn't be soldered.
Best dump the set and get a SB-101 with a TRW built temperature compensated LMO and pinch drive

Message-ID: <dBxR7.11$YE4.3887@newshog.newsread.com>
Source record: 46869

Hi,

I am in the process of purchasing a heathkit dx-60 for my fiancee's son. It's his xmas present. Anyway, he's got his novice license, and the plan is for him to be able to xmit cw on the 40 meter band. Currently he has a mfj 1040 rig, but he's studying for his tech plus and possibly even his general license.

I know a bit about Ham and radio, but haven't gotten a license yet myself. Anyway, I'll need to get some crystals for this rig. I talked to a few people... one person said he thinks the sockets might be hc-17/u sockets. Is that correct?

I think I read once that transmitters don't necessarily transmit on the frequency on the crystal. Instead they often use a multiplier or something on the crystal. Can someone clear this up for me? What frequencies are pretty popular in the 40 meter band and how do I do the math to calculate the actual frequency being transmitted on based on the crystal, or is the frequency of the crystal I stick in the socket going to be the frequency I am xmitting on?

Also, can someone verify for me what kind of crystals I need for the sockets in the Heathkit dx-60? I'm aware that we could track down a vfo somewhere, but the crystal idea just seems neat for some reason, sorta a making do with minimal equipment.

Please cc responses to paper342@yahoo.com so I don't miss any

Thanks

I used a DX-40 with crystals, a Long Time Ago.

Crystal operation requires the operators at both ends to "tune around" quite a bit, looking for stations that are off frequency from each other. This is OK if everyone uses this technique, as they did in the prime days of novices and DX-60s. Practically no one uses this technique today and your future stepson may find operation with a few crystals to be frustrating --- so frustrating that he gives up on hamming. In my opinion, you should go for a VFO.

Bill

I'm restoring a Measurements model 82 signal generator.
The attenuater has a slider that is moved in/out via a
phosphor bronze cable - which is broken. Anyone know
where I can get some of it? I need about 5 feet. The stuff
is woven, and looks like the shield of coax, except that it is
very small diameter. I'd say it is about the equivalent of #20
AWG in diameter. It is used in a dial cord like arrangement,
and is soldered at one point along its length to a brass pulley.
Thanks in advance!

It takes either the FT-214 or the H6C/U, as it has both sockets. It is popular to use 7 mhz crystal on 21 mhz using the third overtone. The 7 mhz novice band is from 7.1-7.150 mhz and fundamental crystals will be used. The 21 mhz novice band is from 21.1-21.2 mhz and 7 mhz crystals in the 7.033-7.066 range will work as the frequency is approximately tripled and he can use them as he upgrades. Obviously though, a VFO would be better. I think it is the HG-10B that matches the rig. jack k8xx

Yes I know a S-38 is only heavy enough for a toy boat's anchor, but at least it's hollow state.

I am restoring a Hallicrafters S-38B and there are some differences between the schematic and how it's wired. There is a 470k resitor between the chassis and the power supply negative that I can't find on the schematic. So, of course the
chassis is HOT in one orentation of the power plug. The manual says all the voltage measurements are in respect to the chassis . The resistor completes the path for the volt meter negative lead, But the radio seems to work fine without the resistor.

I know the line bypass caps provide RF ground so what's the function of the 470K
to chassis other than for measuring the voltages in the set?

There are other difference such as parasitic suppressor resitors that arn't on the schamatic and a different AGC circiut for the mixer/converter,but they make sense.

All the difference seem to be original the solder joints all looked factory old and
oxidized.

Any ideas???

Are you looking at the correct schematic? There were models A thru
E...Most, if not all, are on nostlagiaair. Best advice would be to
replace, or at least verify the integrity of, the wax paper capacitors.
Leaky ones can result in nasty things like voltage on the antenna and in
the case of the 'hot chassis' can essentially tie in your AC line to
parts of the circuit where it may be undesirable :-)
There's different schools of thought on rewiring the AC and switch with
a polarized plug to make it a little safer...Mine had the chassis
isolated from the metal cabinet via rubber mounting blocks.
GL,
Bill

Source record: 46883

You want type FT-243 crystals for the DX-60. They're still
available from JAN Crystals, International Crystal, and maybe
others. The 40m novice band is 7100 to 7150 KHz, and the rig
uses fundamental frequency crystals on that band. The novice
band on 15m is 21100 to 21200 KHz, and they'll be 3rd overtone
crystals (40m crystals tripled work fine... 7033 to 7066 KHz).
There's also a novice band on 10m, from 28100 to 28200 KHz,
and that band takes 4th overtone (7025 to 7050 KHz).

However...

I really wouldn't recommend a DX-60 and crystals for a novice
these days. I'd suggest a transceiver with a VFO. Look for
a Kenwood TS-520S, a Heath HW-101, a Yaesu FT-101E, or some
similar rig. Those can all be bought for under $200, and
they're good starter rigs. I especially recommend the '520.

The dc resistance of any audio transformer is not the impedance. You will need to calculate the impedance of the 6C5 and the impedance of the inputs to the push-pull stage. Then calculate the ratio between the primary and secondary.

Once you calculate the ratio, the actual impedance is unimportant (within reason).

Just a few ratios will handle almost all requirements. Antique Electronic Supply has an assortment of transformers that will fill the bill.

|AWG in diameter. It is used in a dial cord like arrangement,
|and is soldered at one point along its length to a brass pulley.
|Thanks in advance!

Model airplane control cable, available at a hobby shop might do it.

I have some that I bought to use with a set of pulleys to drive a precision pot for position sensing on an old EME array.

This stuff is stainless steel, but for "color coding" one strand is brass plated and will take solder. It might be a little stiffer than what was in there (it's twisted, not woven) but I just tried wrapping it around a 1/4" shaft with no problem.

If you can use a piece 0.015" (AWG 26) in diameter, email me with a mailing address and I'll send it to you.

Here is an excellent web site for S-38 restoration notes. He even
demonstrates how he "recast" the knobs and notes that the rubber isolators
are absolutely necessary for a SAFE chassis.

http://www.concentric.net/~Stwradio/hals38.htm

You should also consider adding a transformer for isolation.

The UK audio designers gave me an idea to look at a toroidal transformer, as
a possible isolation transformer under the S-38
chassis.

I received and e-mail for Brian Gladstone, Director of Engineering at
Plitron Corporation in Canada
http://www.plitron.com

Plitron makes Toroidal transformers, and by my measurements one of their 50
VA units will slip right
in under the S-38 chassis. You can mount it with one screw (use the hole
for the old multi-section electrolytic)
As well as select from a few secondary voltages (110, 117 vac)

Presto, same $ 35.00 USD price (thanks to CDN / USD exchange rates) as a
separate Stancor P6410 (50 VA rating), without hauling around an external
unit. Change AC cord to a polarized plug & fuse and you have a SAFE chassis
around children. A power switch, if desired, could be mounted on the back
chassis (or rework the receive/standby switch on front panel).

I e-mailed to Bob Eslinger, KR1U and he would be interested in hearing from
S-38 restorers who are using this approach
Torroid transformers, due to their low profile, might be a solution for some
of his antique radio restoration clients as well.

Sounds like a "floating ground" hot chassis setup. The real B- ground bus is a wire hooked up to the various terminal strips. Somewhat safer than a true hot chassis where one side of the power cord is switched to a lug securely fastened to the chassis.

>I know the line bypass caps provide RF ground so what's the function of the
>470K
> to chassis other than for measuring the voltages in the set?
>

I'd measure the voltages from the common return, which on your radio is the ground bus wire, rather than the chassis, if I understand correctly. The resistor will prevent static DC voltages from building up across the bypass capacitor. If the bypass cap is .047ufd, it's reactance at 60 Hz is around 60 K, much lower than the 470 K resistor. You might build up such static charges with a long wire antenna. I'd leave it in. I'm sure the resistor is not for some sort of service protection. You must use an isolation transformer.

The original S-38(no suffix) had a true hot chassis. They changed it later to a floating ground design. I don't know exactly when. You may have the wrong schematic. You may find a closer match at:

http://bama.sbc.edu/hallicra.htm

Good luck!

I don't think it's that insane at all. I liken it to the restoration
of a classic car. If you want a 1956 Corvette or an R-390A
that are restored like they just came from the factory, they
well cost you some serious bucks. Like anything else, you
get what you pay for.

I's going to take probably hundreds of hours to completely
strip down a radio, restore all the parts to original condition,
paint, do lettering, assembly, electrical alignment, etc.

I still occasionally see old, dirty, un-restored radios around
for lower prices. It just depends on what you are willing to
settle for.

Banks of these fine radios served the country in all branches of the
military. Additionally,
service with the CIA and NSA to monitor communications from behind the Iron
Curtain.
During the Cold War years, the R390A was so valued it was classified TOP
SECRET, a security measure which remained in force until the mid-1960's.
http://www.avslvb.com/R390A/html/history.htm

Im told old gear cost to much time and paperwork to sell individually, Most
the older non A's had
there radium meters removed, were sledge hammered then went to a landfill
All of the R-390A's at St Jullians creek Great Radio Massacre (most only 5
years old)
http://www.avslvb.com/R390A/html/radio_rape.html
were eventually cleared to be sold per pound in pallets.
However most were to weather ruined for restoration, Fair radio sales has
many parts from them.

: http://www.avslvb.com/R390A/html/history.htm

I've seen this claim there and a few other places. Can anyone
substantiate it? The docs I have for my 390A and my 390 are
classified CONFIDENTIAL or lower, and repair manuals will have
the same classification as the most classified thing they cover.
The idea, after all, is to not give anyone any insight into what
is inside the classified object, so you have to classify anything
that talks about the internals and theory at the same level as
the object itself.

My understanding of the justification behind a TS classification
is that revealing the object or information will cause extremely
grave damage to the national defense.

According to whom? A rather over-generalized assertion not applicable
to every matching or antenna situation, one may safely say. A even
better thing to question, is why one would try to "tell" anyone else
how to sell their own thing in public unsolicited, or purport to
"represent" others who "might be disappointed." And why would anyone
inquire for further particulars of a FS item in public, rather than by
private mail? Is the submitter some sort of hobby-cop, or a wannbe
USENET ad reviewer, or just another wanker in the wasteland this NG is
becoming? If one wished to know or verify the inductance of a roller
inductor, why did not one simply politely inquire of the seller
directly without any further elaboration, or even go investigate the
unit's specs himself?

I worked for NSA back in the late 60's and early 70's using the R390A's on a daily basis. You are correct about the "confidential' classification of the manuals. The top secret part of the R390 was not the radio itself, but rather who was using them and for what purposes.

I've downloaded manual/schematic from there, but it's scarcely
readable :-(So I hoped someone had a better copy...
May be I'd better try again on the site.

Thank you very much.

Thanks For all the help here on line and in e-mail. I had already repalced all the caps and all the out of spec. resistors. The "hot chassis" was the last item.

I looked at the schematics avaialble on line. I couldn'tt find the S-38C but my S-38B is wired closer to the S38-D schematic that I picked up from BAMA.edu.sbc. A great site!.

I'll leave the 470 k resistor in an think about adding a toriod under the chassis for isolation on a permanent basis.

One benefit??? from working on this set is I found that the high side of my "isolation" transformer measures 80 to gnd.! The low side meaures 20 v to ground/neutral. So it is only a marginal isolation transformer.

Primary opened up. Got an order ready for a new one, tho. I didn't
even bother looking at the AES offerings originally since gazing the
prices in the xfmr section usually scares me to death. But after seeing
what PTOP had to offer for old junk ones I figured 14.95 wasn't too bad.
You got one by any chance? Its roughly 3:1. Goes in a GE A-82.
Tnx,
Bill

I have a GE 82. No, you can't have the transformer. Radio
looks like a dead fish.

Replace the primary with a filament transformer with a 110 or 220 VAC
primary. couple the driver plate to one of the P-P output grids
with a .01 capacitor. Will work souuupppeeer till you get the right
part.

Pete

A very large dead fish, but one of my favorite radios. Part should be
here in 3 days or so so I can wait. The old thing was playing fine last
time I used it several months ago but it started crackling with volume
and tone dropping. Any little glitch like clicking the bandswitch, or
thumping the 6C5, etc would bring it back but only temporarily. It had
me chasing all thru the last IF and detector. So for future reference,
it WILL play with an open primary but it will simply sound crappy.
I unpotted the old one to see what I could find. Plenty of tar but no
cigar.
Adios,
Bill

I don't think it's necessarily insane. I liken it to the restoration
of a classic car. If you want a 1956 Corvette or an R-390A
that are restored like they just came from the factory, they
well cost you some serious bucks. Like anything else, you
get what you pay for.

I's going to take probably hundreds of hours to completely
strip down a radio, restore all the parts to original condition,
paint, do lettering, assembly, electrical alignment, etc.

I still occasionally see old, dirty, un-restored radios around
for lower prices. It just depends on what you are willing to
settle for.

Over on rec.radio.shortwave a few folks in Northern USA heard the "s s s s qrz s s s s" in spark. I could not copy it from California. According to the transmitter's website there's a good chance their will be no more legal spark in our lifetime. Perhaps someone will petition the FCC or some other country's agency for a repeat of tonight's demo.

5086. NEED HELP: Yaesu C8 Desk Mic Base

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-13 05:43:16 UTC
From: Michael Moreland - KD5BBC <kd5bbc@swbell.net>
Message-ID: <UdXR7.4787$xZ5.2969680946@newssvr11.news.prodigy.com>
Source record: 46780

I recently received a radio that came with a MD-1 mic and the C8 base. The guy I got the radio from didn't know how to pack - the C8 base got crushed a bit ... cracked part of the PCB and the tone switch was destroyed. The mic works if I plug it directly into the radio, but thru the base it keys the circuit but there is no audio. I have a question about the "Tone Select" switch on the bottom of the base.

What does the "Tone" switch do? One person (who doesn't own one) told me he thought it worked like an equalizer to cut high or low audio - someone else (who also doesn't own one) told me he thought it was an impedance matching network.

Can anyone tell me what this switch really does and what the 3 settings are? I can solder jumpers on the switch pins if I know what they are for.

Thanks!

Michael - KD5BBC

It is a good idea Pete. It wasn't clear in the message. Thought some might misunderstand. Probably a lot of guys that can benefit from that scheme. I have done a similar thing by putting a resistor in the plate circuit of the driver and coupling to one of the grids with the secondary of the transformer still there. I hadn't thought about using a filament transformer though.

5094. R-390A PTO - Questions About "Dry" Nitrogen Charge

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-13 19:36:03 UTC
From: The_AntiArt <The_AntiArt@Hoax.Land>
Message-ID: <616406A74F35F1C6.F068A23E89C87A3A.72C37EE8D4BADA82@lp.airnews.net>
Source record: 46788

PTO's for R-390A receivers generally contain crystalline hydrate packets and have o-ring seals and pressure fittings in the housings which indicate they were intended to be pressurized with "dry" Nitrogen to reduce internal moisture. (Presumably to improve stability.)

After 30-40 years it is reasonable to assume that these would require " baking out" of the hydrate packets, reconditioning of the seals, and recharging with Nitrogen to restore them to original condition.

Is this worth doing if receivers are being used in a "benign" temperature controlled environment (such as in a home)?

5095. R-392 Performance Compared to R-390

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-13 19:44:39 UTC
From: The_AntiArt <The_AntiArt@Hoax.Land>

Source record: 46790

People have always referred to the R392 as a mobile
version of the R-390, but is this true from a performance
standpoint?

I have both types of radios and realize that the basic
design concepts are similar, but was wondering if
anyone has done a technical analysis comparing
their overall performance.

5096. Need Cushman CE-4 Manual Page copied

Newsgroup: rec.radio.amateur.boatanchors

Happy Holidays all. I am working on a Cushman CE-4 and need to know if
anyone might have a manual that can email or snailmail me a copy of one
or two pages. I have found out that there is a
problem with a board on the bottom of the unit. The 0710-7001 board had
two
transistors that went up in smoke. I cannot find my manual for this
model and the CE-6 seems to have different boards.
It is the fourth board on the bottom front row, counting from the bottom

as the unit is on the bench facing you. It has three pots and a
horizontal potted coil, and two IC's on it. There are a bunch of
transistors located near the edge connector, toward the right side of
the board. I need to know the numbers of the transistors and some of
the values of the parts. Thanks Don KB6GQA

I ran both, side by side for years. They are essentially identical, with the exception that the passband filtering and added features on the R390 compared to the R392 make the R390 a better fixed station receiver. Still, for most things, I would take the R392 over the R390. It is easier to service, less fussy to tune, but has the drawback that those funky 28v tubes are nightmares. I once FET'd my R392, using Vector tube bases and had the whole thing running on 24vdc at about a half amp (mostly the lights inside), and it was hot as a firecracker. It boils down to whether or not you need the additional filtering of the R390 or not. I liked the portable operation capability of the R392 for things like FD operations, and it was easier to QSK than the R390.

I have on here, they sound more like 390A's with the mechanical filters.
If your a serious SWL or BCB DX'r the audio may not be for you (mechanical
filters sound harsh and ring)
I never did a technical analysis, but this it what I can hear.
I dont like all the cable coming out the front, the get real messy as a desk
top

Source record: 46793

Just for "what it's worth", I've spent most of my career repairing and using
R390, R390A and 392's. While the 390 may make some users feel warm
and fuzzy, I'll take the "A" when in a tight spot and need some real
selectivity.
In my mind, the 390 is a fine reciever, but the 390A outperforms it going
away. Sensitivity, and overall performance seem better on the newer design.
I had 350 recievers to maintain, some of each. Ops liked the "A" better
hands down. There were just some functions that were set up for the
390 and had to have them.

The 392 was actually a pretty fine reciever for mobile use, but like Joe
said, a pain in the backside to power up and keep in the bench. Built like
a Mack Truck, they hold their senseitivity fairly well even with rough use.
Think the FET mod talked about would be the finest way to use one
in either fixed or mobile.

So......like I said, FWIW

Best of the Season to all....

Hi AntiArt,
I believe that if you were to untape the lil crystal
containers from the PTO rails, heated them up, a hair dryer on HI
works OK, until they change color from pink, to a lighter pink, (or
get them as white as you can) you will be doing OK.. Sticklers will
say to find replacement crystals, and snip off one end and refill
them... But I wonder why... I would just heat the things up as good as
I could, without melting the clear plastic, and then retaping them to
the rails.. Next, use your wifes hair dryer again, and heat the whole
innards of the PTO, (after regreasing the leadscrew, corrector
assembly, end bearings, etc) and while still hot, push the can back
on, and replace the screws... I have heard alot of folks that will go
to the trouble of baking them in an oven at 100 degrees or so... But,
I think the hair dryer routine works fine.. I have done many "A" line
PTOs, including my KW-1s 70E-14 PTO in such a manner (BTW, many of the
early "A" line equipment have no dessecant crystal containers at all)
and, after recalibrating on the bench, heating them in the above
method, etc., they seem to be just as stable as any good working
Collins PTO..(provided you resolve (if any) electrical problems first)
Some final food for thought... If you have ever had an "S" Line 70K-2
PTO apart, you will notice there is no heremetic sealing at all, just
pieces parts in a lil square box.... Even Collins perhaps felt that
hermetic sealing was a bit too much of over engineering... Later..
Tony.

> Russ WA4POD

Russ,
It has been suggested to me that the 83 is not up to the task even though
they are n.o.s. It is also possible that when you factor the age of our
machines and variances in manufacture of components that our boxes light up
when they shouldn't. It had read that the bulb should never glow unless
there is a problem. Now I am learning that is not always the case and the
bulb is also acts as current indicator of sorts. I.E. If the filaments in a
radio are in series this would be useful to spot a tube with and excessive
draw. Having done one of my testers with the SS upgrade. I am inclined to
leave to other one alone for now. It certainly stopped the light from
glowing when I put the 1N4005s in.

I also own an R-392 and love it, I have a cousin of it as well and don't have a great deal of info on it. Three years ago, a friend of mine passed away and several of us were allowed to pick a few pieces of gear from his estate. I picked a couple of receivers, the executor practically forced me to take this ARR-41/R-648, I wasn't really interested, but took it anyways. It sat idle on a shelf for two years before I plugged it in and used it. Now I won't part with it, mainly because I realize it's a close relative to the R-390. Anyone have anymore info on it?

Thanks for your help. I mainly DX with an R-390A, but sometimes
I fire up one of the R-392s.

I have built some plug-in IC audio modules which work well in the
R-392s. I know there was an OEM plug-in transistor amplifier module
available, but have not seen any.

I have been searching for a set of "solid-state" conversion plans
for the R-392 similar to what you did with the FETs. Someone out
there must have it on a website.

Again Thanks.

Thanks for your help.

I generally DX with a R-390A and a CV-157 SSB converter.
(The CV-157 is a big huge and heavy boatanchor, but works
well.)

The only problem I have had with R-390As is some occasional
"tinneyness" in the audio which I am told is related to the
mechanical filters. Otherwise they beat everything else I have
used for general use, including the latest synthesized radios.

Every now an then I fire up an R-392. (I rarely ever use the
old R-390 anymore.)

I am 43 years old and have been accumulating this stuff
since I was a kid. I love the tube type equipment. Besides,
as I tell my family, if we really ever had a nuclear war, these
would probably be the only radios that still worked!

AMATEUR RADIO NEWSLINE(tm) REPORT #1269 - DEC 7, 2001

Amateur Radio Newsline report number 1269 with a release date of Friday, December 7, 2001 to follow in 5-4-3-2-1.

The following is a Q-S-T.

The FCC says no to a Winter Olympics special call sign and a new Extra class exam starts next summer. Learn what's in it on Amateur Radio Newsline report number 1269 coming your way right now.

(Billboard Cart Here)

**

THE 2002 WINTER OLYMPICS: FCC SAYS NO TO SPECIAL CALL SIGN

An idea for a special events call sign to celebrate the 2002 Winter Olympics has drawn a negative response from the FCC. Tom Schaefer, NY4I, of Sandy, Utah, had requested that the agency allow amateurs Utah hams to substitute the number 2002 or 02 for the 7 in their callsign. This, for the time period preceding and up to though the 2002 Winter Olympics in Salt Lake City. But after mulling it over for a few months the Schaefer says the agency responded with a definite no:

--
Schaefer Here:
In-Q: I wrote a letter...
Out-Q:...as a different prefix.

The letter to Schaefer was signed by D'wana R. Terry. Terry is Chief of the Public Safety and Private Wireless Division of the Wireless Telecommunications Bureau. Among the reasons Terry stated in refusing the special call sign request was that the block of special event callsigns requested did not fall into the commission's special event callsign format. Also, that the request was inconsistent with International Radio Regulations. Schaefer says that he is disappointed at the FCC decision to deny, and also a bit surprised:

--
Schaefer Here
In-Q: The letter I...
Out-Q:...unable to do that.

Does this mean that there will be no ham radio involvement in the 2002 Winter Olympic Games? Not by a long shot. According to Schaefer members of the local ARES groups will be assisting in providing communications for the event. And

there’s a good chance that someone will pick up the ball and get some sort of special call sign using the established call sign administrator program.

By the way, you can hear more with Tom Schaefer NY4I about ham radio at the Winter Olympics on this weeks RAIN Report. Its on the web in Real Audio and Windows Media at www.rainreport.com and by telephone at 847-827-7246. That’s 847-827-RAIN. (ARNewsline(tm))

**

THE ARCTIC WINTER GAMES

Another event called the Arctic Winter Games are also in their planning stages. In this case, ham radio is an important part of the event. Q-New Graham Kemp, VK4BB, tells us the who, the what and the where:

--
Greenland and the call-sign OX1AWG is on the air from Nuuk Greenland as a participant of the Arctic Winter Games going to be held in Iqaluit Nunavit and Nuuk Greenland 17th - 23rd of March 2002.

OX3HX, Rene tells us any Hams bringing a valid License original will be welcome to use the local club station OX3NUK for a small fee. If you would like to have your own OX3-call, ship a copy of the license but they need to have the papers 3 weeks in advance. Hams who like to operate OX/Home call or OX1AWG are welcome too, and have only to show up with original valid license.

For the Amateur Radio Newsline, Im Graham Kemp, VK4BB, of Q-News Australia.
--

For those planning to visit Greenland for the games, Rene Witkowsky, OX3HX will be available at one of the many Help Booths around the city. (Q-News)

**

DX RECORD: 73 KHZ DISTANCE RECORD INCREASED

Yet another new low frequency record has been achieved on the 73 kHz band. Jeramy Boot, G4NJH, has more:

--
“On the 21st of November, just before midnight UTC, W1TAG received extremely slow CW from G3AQC. This was the first time that a complete callsign had been copied, though partial calls were identified the previous night.

The opening lasted around two hours and was the culmination of several weeks of testing. At a distance of 5291 kilometers, G3AQC smashed his own record of 4408 kilometers when his 73kHz transmissions were received by VE1ZJ last June. He was running 200 milliwatts ERP.

The transmission was in Differential Frequency CW, where the dots and dashes are the same length but on slightly different frequencies, and with no space between them.

Jeramy Boot, G4NJH”
--

The Differential Frequency C-W communications system used for this contact holds the promise of extending this record even further. (GB2RS)

**

BREAK 1

This is ham radio news coming to you from the United States of America. We are the Amateur Radio Newsline, heard on great bulletin stations around the world this week honoring the Antelope Valley Amateur Radio Club Wednesday Night Net serving Lancaster California.

(5 sec pause here)

**

HAM RADIO IN SPACE: EXPEDITION 4 HEADS TO THE ISS

Amateur Radio is keeping an eye one space this week. On the International Space Station to be more exact, as we witness a changing if the guard. The third group of Astronauts and Cosmonauts headed by Frank Culbertson, is getting ready to come home. They’ll be back on Earth December 16th, after being in orbit since last August.

Expedition 4, Yuri Orufrienko, Dan Bursch and Carl Walz will take over and be up there until next May. Onufrienko once operated from the Mir Space Station; Bursch is KD5PNU and Walz is KC5TIE. So hams can look forward to contacts with them.

Amateur Radio on the International Space Station; ARISS; will continue on the air with two meter voice and packet. Voice contacts with schools all over the world have been well served and those exciting contacts will continue at a rate of one or two a week once the new crew settles in.

In addition to operating ham gear, the new crew has also carried new Amateur Radio antennas to the station. They were designed and built in Italy to Russian specifications, then space-qualified and shipped to the United States.

The Astronauts plan at least eight space walks, two of which will be used to install those antennas outside the crew quarters. They should provide a wide range of frequencies and vastly improved coverage of the ham bands for the ARISS station.

The space station call, while flying over the United States is NA1SS. The 2 meter downlink frequency is 145.80 MHz. Look for the new crew on the air from orbit in the near future. ARNewsline(tm))

**

HAM RADIO TESTING IN THE USA: NEW EXTRA CLASS EXAM QUESTION POOL RELEASED

If you are planning to upgrade to Extra class, now might be the time to do it. This is because a new and somewhat more difficult Extra Class exam will go into

effect next summer. Amateur Radio Newsline’s Norm Seeley, KI7UP, has the details:

--
The National Conference of Volunteer Examiner Coordinators Question Pool Committee has released a revised and expanded set of Element 4 Amateur Extra questions. Use of these questions begins next summer and replace the current Extra class question pool released back on April 15, 2000. That’s the day Amateur Radio ''restructuring'' became effective.

The new Element 4 pool expands the number of questions by more than 20 percent. The new test pool has 806 questions as opposed to 665 in the current Extra class pool. It also contains more technical material. In fact, more than half of the questions cover electrical principles, circuits, signals and emissions.

The 50 questions in an Extra class examination are drawn from the question pool. FCC rules say that an applicant must correctly answer at least 37 questions of the 50 to receive a passing grade.

The new Extra class question pool becomes effective July 1, 2002, and must be used to generate all Extra class written examinations administered on or after that date. The questions are available on the ARRL Web site and will remain valid through June 30, 2005.

For the Amateur Radio Newsline, I’m Norm Seeley, KI7UP.
--

The Question Pool Committee now will turn its attention to developing an outline for the Technician class Element 2 question pool. A draft version is scheduled for public release and
comment next spring. The ARRL website address is http://www.arrl.org/arrlvec/pools.html to find the Question Pool. (ARRL Bulletin, NCVEC)

HAM RADIO TESTING IN THE U-K: UPGRADING MORSE TESTS UNDERWAY

Meantime overseas, the United Kingdom is in the process of administering a lot of slow speed Morse code exams. This, following the an announcement by that nations telecommunications agency that U-K Full and Intermediate Class B license-holders can operate on the High Frequency bands under the new Foundation license by simply passing a code test.

Called a Morse Assessment exam, the Radio Society of Great Britain is arranging for sessions to be held nation-wide. The RSGB hopes that at least two sessions per region will take place between now and the end of December.

The RSGB says that these tests are open to both members and non-members of the society. So far twelve sites have been approved for training and testing of the new U-K Foundation License. (GB2RS)

**

ENFORCEMENT: AMATEUR RADIO ROAD RAGE MUST STOP

The FCC's chief ham radio rules enforcer has told those attending the Ft. Wayne Indiana Hamfest that the time for on the air arguments has come to an end. Riley Hollingsworth, the FCC's Special Counsel for Amateur Radio enforcement told the forum that Amateur Radio road rage must stop now and that the bickering on our frequencies can do nothing but hurt Amateur Radio in the long run.

Hollingsworth also says its time for more hams to get involved in public service. Jack Parker, W8ISH, of Amateur News Weekly, has that part of the story:

--
"Hollingsworth says that it is now time for hams to use frequencies responsibly. He adds that now, more than ever, is the best time for all Amateur Radio groups to seek out and establish working relationships with local emergency response agencies.

Since September 11th, Amateur Radio and its potential has moved into a prominent position on the national front. But he stresses that we must move quickly at a local level to establish our place in the overall emergency response plan.

Reporting from the Ft. Wayne Hamfest, for amateur News Weekly, I'm Jack Parker, W8ISH."
--

Hollingsworth's views are echoed by many who are already involved in organizing ham radio emergency communications on a local level. They say you can never have to many well trained volunteers. (Amateur News Weekly)

**

SPECTRUM USE: FCC OPENS UP MORE SPECTRUM TO COMMERCIAL USERS

The government has moved to eliminate a cap on how much spectrum any one wireless company can own in a given market. The decision opens the way for mergers between major carriers and allows them to provide more mobile services such as high-speed Internet access.

The Federal Communications Commission had previously limited the amount of spectrum that an operator could own in a particular geographic area, in an effort to prevent a single giant company from squelching competition in that market. But in a recent 3 to 1 vote, the agency decided to immediately raise the amount of bandspace a company can own from 45 MHz to 55 MHz. This is an increase of more than 20 percent. The FCC plans to completely eliminate the limit in January 2003. (FCC)

**

HAMVENTION 2002: TIME TO NOMINATE REMINDER

Another reminder that the Dayton Amateur Radio Association has opened the nominating period for the 2002 Dayton Hamvention Awards. There are three

awards presented each year. They are the Radio Amateur of the Year, Special Achievement, and Technical Excellence.

All amateurs Novice through Extra are eligible. Awards are decided by the Awards Committee, based partially upon the information received. Magazine articles, newsletters, newspaper clippings, videos and the like are appreciated but cannot be returned. The deadline for nominations is January 31, 2002. Nominations can be submitted by US Mail to Post Office Box 964, Dayton Ohio 45401 or by completing the convenient e-form on the web at www.hamvention.org. (DARA)

**

NEW HAM TECHNOLOGY: THE ELECRAFT RIG CONCEPT DESIGN CONTEST

Want to design the ham rig of the future and maybe win a prize? Well, Elecraft says that it will be giving three of its new EC1 project enclosures to those who submit the most interesting suggested designs concepts.
--
Eric Swartz WA6HQQ: “There’s quite a strong building and homebrewing community inside of the QRP’ers -- the low power operators -- these days. In fact, that is how we got our start.

We have broadened our audience past that and have pulled a lot of hams from the mainstream higher power groups to it also, but those guys (the QRP operators - ed.) build an awful lot of stuff. We are continually seeing folks talking about new project ideas and new things to design. It is quite a fertile group of people so I think we are just kind of servicing that need.”
--

Elecraft says its taking this rather unusual step to away to help stimulate the creative process within the ham radio community. According to Elecraft’s Wayne Burdick, N6KR and Eric Swartz, WA6HHQ, design concepts submitted can be for virtually any ham-related application, but they must be compatible with the Elecraft EC1 enclosure. The EC1 is the same size and color as the K1 transceiver. No schematics are required and designers are under no obligation or expectation to actually build the proposed projects. More information on this unique design contest along with all the rules is on the web at www.elecraft.com. (Elecraft)

**

ELECTRONIC BUSINESS: AILING POLOROID FILES CHAPTER 11

Polaroid has been known to generations of consumers for its instant cameras and film, and more recently as a supplier of digital imaging products. Now Poloroid has filed for Chapter 11 bankruptcy protection.

According to news reports, the company was unable to keep up with the new digital technologies of the photography world. It also has struggled with nearly $1 billion in debt. (Published reports)

BREAK 2

News never goes home for the holidays and neither do we. We are the amateur Radio Newsline with links to the world at our only official website - www.arnewsline.org.

**

EMERGING TECHNOLOGY: BRAIN DISEASE SUPERCOMPUTER

The University of California at San Diego will coordinate a consortium of interests banding together to build the first nationwide computer network for studying diseases of the brain. The network will enable researchers to share information on neurological diseases such as multiple sclerosis, schizophrenia, Alzheimer's disease and Parkinson's disease. The National Center for Research Resources, part of the National Institutes of Health, awarded the consortium more than $20 million for the project, which will enable researchers to share brain images via a high-speed network. (UCSD release)

**

HAM RADIO IN SPACE: FREE UPDATED TRACKING SOFTWARE

An updated version of the PREDICT satellite tracking and orbital prediction program is now available. This latest updated corrects some errors that have caused instability under certain conditions in the past. The program's documentation has also been updated, and new versions in Portable Document File and HTML have been added. PREDICT is free software.

The latest DOS version may be downloaded from ftp://ftp.amsat.org/amsat/software/PC/tracking/predict2.zip >. Further information on PREDICT software is available at http://www.qsl.net/kd2bd/predict.html.

Also, new Linux version is currently being prepared for release as well. (KD2BD)

**

INTERNATIONAL - SOUTH AFRICA: NO HT’S IN THIS CAR

Radio Amateurs in South Africa can no longer use a hand held radio in a vehicle unless its attached to a hands free operating system. This is the result of a new law that says that no person will drive a vehicle on a public road while holding a cellular telephone or any other communications device in one or both hands.

To operate mobile, hams and non hams alike now must use a radio permanently mounted in the vehicle and adapted to hands free operation. The law permits mobile radio operators to use such devices as a permanently mounted microphone and speaker or other specialized gear to comply. (SARL, Q-News)

**

INTERNATIONAL-UK: MARCONI 100TH ANNIVERSARY

The 100th anniversary of the reception of the first trans-Atlantic radio signal by Guilermo Marconi at Signal Hill in St. John's, Newfoundland, takes place on Wednesday the December 12th. In celebration, a number of United Kingdom special event stations will be active to commemorate the event.

Most of the operations will take place on the 12th of December itself. Even Great Britain’s Radiocommunications Agency is getting into the act. It will be operating GB100WT from its laboratory site at Whyteleafe, Surrey, during part of December including, they hope, the full 24 hours of the 12th of December. The Radiocommunications Agency expects to be operational on the High Frequency bands as well as 2 meters and 70 centimeters. The station will be operated by Radiocommunications Agency staff in addition to members of local radio clubs and will welcome QSOs with stations worldwide. (RSGB)

**

RADIOSPORTS: WRTC-2002 REMINDER AND UPDATE

A reminder that the next World Team Radiosport Championship will take place next July in Finland. The games will be hosted by the Finnish Amateur Radio Society and the Contest Club of Finland. WRTC brings together over fifty two man teams made up of the best contest operators from around the world. The actual on-the-air competition pits two man teams operating from a common geographic area using identical equipment, power and antennas.

To get a good idea of what goes on at the World Radiosport Team Championship games, film-maker Dave Bell has produced a half hour documentary video titled “The Ham Radio Olympics.” Its priced at only $19.95 and is available on video CD or VHS tape from the American Radio Relay League. More information is on the web at www.arrl.org. (WRTC, ARRL, W6AQ)

**

DX

In D-X, word that wore torn Afghanistan is back on the air following the ouster of Taliban forces from most of that nation. Q-News Graham Kemp, VK4BB, is back with the details:
--
Graham Kemp VK4BB:

“World traveller Peter Casier, ON6TT (5X1T), has been in Afghanistan for the last few days and has now obtained permission to operate in this worn torn nation.

On November 21 he was QRV as YA/ON6TT/M operating in a convoy. The foreign ministry of the Islamic Republic of Afghanistan (Northern Alliance) issued the call YA5T, which can be used on all bands by Peter, ON6TT, Matts, SM7PKK, and Robert, S53R.

Wayne Mills, N7NG, will have to look at the permission, once it is received. His initial reaction was that it should be good for DXCC. Peter will hopefully be contacting Wayne and submitting the documentation. Meantime, look out for these three operating as YA5T.”
--

And late word from the ARRL’s DXCC Desk is that it has already received acceptable documentation for YA5T and has approved it for credit. (Q-News)

Several DX newsletters report that N6TJ is active as ZD8Z from Ascension Island again. He is expected to be there through the 18th of December. QSL as directed on the air. (OPDX, Modern DX’er)

Lastly, word that high seas have forced the Ducie Island DXpedition team to abandon its already-delayed effort to reach that DXCC entity located in the South Pacific. According to the RSGB, the team was some 80 nautical miles from its destination and facing high seas when the decision was taken to turn around and head back to Pitcairn Island. (GB2RS)

THAT FINAL ITEM: STRANGE SCIENCE - FAT BIRDS FLY BETTER

About twice a year we bring you stories about radio tagged migratory birds. In most cases its those ever elusive Burrowing Owls. Now we have a totally different kind of bird story. It still involves radio tracking, but this time to see if bigger birds or smaller birds have a better chance to survive in flight. Amateur Radio Newsline’s Joe Moell, KO0V has more:

--
European scientists have discovered what seems like a contradiction about migrating birds. They found that the fatter the bird, the more efficiently it appears to fly.

Researchers at Lund University in Sweden have studied several small species including the Red Knot. In our hemisphere, these 20-ounce wading shorebirds travel 18,000 miles every year, to the tip of South America and back to the Arctic. On the way north, they stop on the shores of New Jersey to feast on the eggs of horseshoe crabs, to build up energy for the last 2000 miles of their northward trip, which they make non-stop. On these binges, the Red Knots can double their normal body weight.

Over the past few years a number of European Red Knots were radio tagged and tracked by the Swedes as they prepared for a similar trip between the British Isles and the Russian Arctic. The study indicates that building up of fat deposits to be burned as fuel during the migration is more than worth the energy that it takes to carry the additional weight. The heavier birds apparently use their muscles more efficiently. Just why this is so remains a mystery. Even stranger is that the results seem to 'fly in the face' of a central theory of aerodynamics -- no pun intended of course.

So what does this have to do with ham radio? Well, it points out that research always seems to yield unexpected results, and it gives me a chance to remind you that dozens of ham operators in western states are listening for the VHF radio tags on endangered Burrowing Owls this winter. You could help out too. Find out by visiting my Web site -- www.homingin.com. Who knows, maybe a ham will make a similar startling discovery about the migration habits of these unique critters. That's homingin -- one word -- for the Web site, homingin.com.

For Amateur Radio Newsline, in southern California, this is Joe Moell - K-zero-Oscar-Victor saying, "no jokes about birdbrains, please."
--

All of this really goes to show that the more mankind uses science to discover the secrets of Mother Nature, the more amazed man is at what he learns. (Ecology Today)

None of my Thordarson catalogs shows that numeric format. Pre-55 transformers were all 21- or 22- series. Then they started 1A, 2A, etc. I would initially suspect that is a manufacturer's part number, rather than a Thordarson number.

Hello!

I am selling a Hallicrafters R-46 speaker:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1308649152

The current price is $35, the cabinet is very very clean, and there
are pictures at the link above.

If you live in the US (lower 48) I can get it to you before Christmas.

The speaker is intended, I am told, for Hallicrafters SX-71, SX-88,
SX-100, SX-122 or other radio.

The boatanchors FAQ says you welcome commercial postings. I hope this
email has found a welcome audience.

I've always considered tube testers for emission as a poor substitute
for true Gm testers, such as the B&K and Hickock testers. Emission is
okay for larger power tubes like the 6L6 and the like, but for small
signal tubes nothing beats a transconductance test.

What you might be having is a short between cathode and the suppressor
grid which are usually tied together.

guess you would have to find someone who still used an RCA TT6AL
transmitter. That's the only one I remember that used that tube . .
or a TT5A that had been converted to air cooled tubes.

Good luck

Didn't see this comment directly addressed, though much other good
input. Many of the less-complex testers will show a "short" at one
pin position due to this position being the heater or another normal
internal connection. One may have missed (or be missing) the
instruction sheet, which will typically tell this.

I'm currently working on repairing a National NCX-5 mark II
transceiver. I have located a copy of the manual
on the internet. I wonder if anyone out there has any
technical bulletins or other documentation that I could
get a copy of.

I've got a list of symptoms to work through. Also, I've got
an apparent modification. A white wire comes into the
carrier oscillator area but is not connected to anything,
just covered with tape. It has around +250 volts on it.
The wire is packaged in such a way that it appears to be part of
the original construction, but since disconnected.

I am hoping maybe there is a service bulletin somewhere that
can explain it.

- 75S-1 Receiver, $600

- all items above with cables, $1500

- 30L-1 Linear Amplifier, $800

- S-line plus cables plus amp, $2100

- all items are in very good condition and working perfectly, except for a couple of scratches on the 312B-4. Station is on the air and working great. No haggling, please, prices are firm. Serious buyers please call for serial numbers or on-air demo. Pictures available by email. Call Tim, AL0F, at (520)398-9543 or email at <<tbal0f@aol.com>>.

5140. cabinet to chassis screws - ef Johnson

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-15 00:09:01 UTC

U guys: I now have a Ranger and a Valiant. Both have NO SCREWS to attach the cabinet to the chassis. Does anyone know the EXACT specs on the screws. I'd rather do it right the FIRST time.... (a possible first for me...)
Thanks, Frank ng0n reply direct: paxton@bulbbopper.com

5141. FA: EICO Model 666 Tube Tester

> Gary Hildebrand WA7KKP

I know the higher $$$ testers usually are quite a bit more
reliable/accurate. I've got two of them. A hickok 539c and a sencore
MU-140. Both are pretty good and both were fairly high $$$ testers
when they were new. I use the sencore quite a bit. It's in a smaller
package than the hickock and it's fairly accurate. Of course everyone
knows about the hickoks. One thing about tube testers...They all are
getting old...So you need to watch out for bad caps, etc. MK

HAM RADIO IN SPACE: ANOTHER TOURIST TO THE ISS

Could there be another ham radio space tourist headed to the International Space Station? Well the ham radio part is not yet known, but NASA and its partners in the I-S-S have agreed in principle to let a 28-year-old South African become the second paying tourist on the orbiting outpost. Amateur Radio Newsline's Roy Neal, K6DUE, has more:

--
The International Space Station may get its second paying customer next April. South African businessman Mark Shuttleworth has signed a contract with the Russian Aviation and Space Agency to buy a seat.

Kirsten Larson, a spokeswoman for NASA, has confirmed tentative agreement with the various space agencies that would allow him to fly. Shuttleworth is to go up to the I-S-S on a Russian built Soyuz. The arrangement was negotiated by Space Adventures, an American company in
Arlington, Virginia. That's the same outfit who made the arrangements for Dennis Tito, the first space tourist. Tito, KG6FZX, was allowed to get on the ARISS radio while he was up there and created quite a stir on 2 meters.

Mark Shuttleworth is not licensed at this writing but has said that he plans to be more than just a tourist looking back at earth. He has said he will take part in a number of scientific experiments. It's not too far fetched to suggest that he may be talked into taking the time to get a ham license, time permitting, as he trains for the flight. He will have to train extensively to meet rigid standards before getting final approval. If all those ifs go together, next year ham radio may have its second tourist in space to talk to and about.

For the Amateur Radio Newsline, this is Roy Neal, K6DUE

--

Ironically, the proposed date of Shuttleworth’s visit to the I-S-S would be almost exactly a year after Dennis Tito made his visit. That flight last April raised objections at the National Aeronautics and Space Administration about his fitness and training. No such problems this time around. (ARNewsline(tm) from various sources)

**

HAM RADIO IN SPACE: ISS CELEBRATES MARCONI

The International Space Station's returning skipper marked the 100th anniversary of the first trans-Atlantic wireless contact by chatting with youngsters at the exact spot history was made. The contact took place on Wednesday, December 12 th as the station, docked with the shuttle Endeavour soared over the North Atlantic, off the Newfoundland coast.

During the short QSO, outgoing station Commander Frank Culbertson, KD5OPQ, used two meter F-M to speak to teen-agers gathered at the Signal Hill National Historic Site of Canada in St. John's, Newfoundland. Culbertson managed to answer 10 questions from the students before the I-S-S flew out of range.

One of the questions asked of Culbertson was how he bathes and brushes his teeth in orbit. Another was how he gets along with his crewmates in such close quarters, and whether he misses home.

His answers? KD5OPQ told the youngsters that uses damp cloths and no-rinse shampoo, that he swallows the toothpaste since there's no sink, that he gets along fine with his colleagues, and sometimes does wished he were home.

The contact was facilitated by ARISS – Amateur Radio on the International Space station as part of an educational program at Signal Hill celebrating Guglielmo Marconi's success in receiving a wireless signal. That transmission came from Cornwall, England, on December 12, 1901 and consisted of nothing more than three dots. That’s the letter S transmitted in Morse code.

For the Amateur Radio Newsline, I’m Mert Garlick, N6AWE. Jim. (AMSAT-BB, AJ9N and ARNewsline(tm) from published news reports)

**

HAM RAIO IN SPACE: NEW HAMSAT IN 2002

Look for a new ham radio satellite to be launched in 2002. The new bird called Kolibir-2000 is a Russian and Australian School joint scientific and research microsatellite.

Miles Mann, WF1F, of MAREX reports that the new bird will be taken to orbit during a Russian a cargo mission to International Space Station. Kolibir-2000 will then stay in space attached to a remote port before being launched. (AMSAT-BB)

**

ENFORCEMENT: FCC SAYS IT WILL NOT INTERVENE IN ALABAMA NETMESS

The FCC's Enforcement Bureau has in refused to take sides in a dispute between several nets wanting to use essentially the same frequencies on the 75-meter band. The bickering had pitted the Alabama SKYWARN Net , the Alabama Traffic Net, the and the Country Cousins Net against a newly formed informal gathering of hams in another loose knit network.

The Alabama SKYWARN Net, the Alabama Traffic Net, the and the Country Cousins Net have long operated between 3.965 and 3.970 MHz. The informal group decided to try to use the same spectrum. That’s when the dispute erupted and everyone wrote to the FCC. After reading the complaints, Special Counsel for Amateur Radio Riley Hollingsworth told all four that it was really up to them to solve the problem, and to do it without breaking any rules:

--
Hollingsworth: “We issued a letter to all parties in a 75 meter interference dispute and we warned all parties and [also] attempted to explain what incidents were enforcement problems and what activities were just poor Amateur practice and degrading the entire service.”
--

Hollingsworth’s response went to Henry Willmon, WA4GQS, Sal Viglione, W4SAL, Jeremy Jackson, K9CNI, and Alabama ARRL Section Manager Bill Cleveland, KR4TZ. (FCC, RAIN)

**

ENFORCEMENT: FCC WARNS UNCOORDINATED REPEATER OWNER AND HIS USERS

The FCC has again written the operator of an uncoordinated Southern California repeater about ongoing interference. Again the FCC’s Riley Hollingsworth:

--
Hollingsworth: “We issued a second and final warning to a Los Angeles California licensee; Angos Winke, KC6OKA, about operating an uncoordinated repeater that is interfering with the coordinated repeater W6IER. {This is] a repeater operated by the Inland Amateur Radio Club.
That licensee will also be receiving a letter from the Los Angeles office prohibiting him from using Automatic Remote Control for the repeater.”
--

That means the system can only be on the air when there is a control operator present and that ham will be held responsible for any interference caused by the repeaters transmitter.

But that’s not all. The FCC has also sent letters to several users of the uncoordinated repeater a warning of their own:

--
Hollingsworth: “We sent warning notices to five licensees in the Southern California area concerning operation on the coordinated repeater I mentioned a moment ago: The one that is causing interference to W6IER. This is in addition to the action mentioned about taking the licensee off of Automatic Remote Control. And we warned them about interference to the coordinated repeater.”

--

Each of the letters says essentially the same thing. That the FCC has information indicating that interference to the repeater has been occurring from each of the users stations through a repeater on the same frequency as W6IER, but one that uses various call signs. It warns the users that continued interference to the W6IER repeater could result in a monetary forfeiture of up to $7,500. Also, depending upon the evidence, revocation and suspension issues might also be warranted. (FCC, RAIN)

BREAK 1

This is ham radio news coming to you from the United States of America. we are the Amateur Radio Newsline, heard on great bulletin stations around the world, including the Broward Amateur Radio Club net serving Ft. Lauderdale Florida and vaccinate.

(5 sec pause here)

**

FCC: FCC LIBRARY CLOSED TO THE PUBLIC

Effective December 5 th and until further notice, the FCC Library is closed to the public. This action is said to be necessary because the Commission is using a portion of the library to temporarily house FCC employees. More information is on the web at http://hraunfoss.fcc.gov/edocs_public/attachmatch/DOC-218204A1.doc (CGC Communicator, FCC)

**

RADIO DISASTER: MISSOURI TOWER FALLS

A 1,627-foot broadcast tower near Springfield, Missouri toppled to the ground Friday morning November 30th from the weight of a foot of ice from several days of freezing rain. According to a report from KYTV the 33-year-old tower collapsed on itself like an accordion.

No one was around and the damage was confined to the area around the transmitter building at the base of the tower. No engineers were in the transmitter building when the accident occurred.

KDEB television and KTXR-FM were the resident broadcasters on the tower which was owned by American Tower of Boston. The total height included the 1,560-foot tower plus the antenna on top of it. The loss could cost American Tower or KDEB millions of dollars. (Listener reports)

**

HAM RADIO HELP: THANKSGIVING BASKETS

On a much happier note, a group of Indiana hams make the news this week for their generosity. Amateur News Weekly's Jack Parker, W8ISH, tells us that the radio amateurs recently brought some holiday cheer to those who might not otherwise be able to celebrate:

--
Thanksgiving came early for many residents of Hamilton County. A half dozen Hamilton County Amateur Radio operators helped to deliver over 200 Thanksgiving food baskets to shut-in residents across the county.

This is an annual project headed up by John Wadsworth AA9KB. The food baskets are arranged by the local chapter of the American Red Cross.

Reporting for Amateur News Weekly, I'm Jack Parker, W8ISH.
--

Jack says the Hamilton County hams will be back again next year. (ANW)

**

HAMVENTION 2002: FORUMS SCHEDULE ANNOUNCED

If you are thinking about attending the 2002 Dayton Hamvention, then go its website and click on the Forums area. Forums Chairman Jim Ebner, N8JE, says that the initial schedule for next May's Dayton Hamvention group discussion sessions is now on line and Amateur Radio Newsline's Don Wilbanks, KC5MFA, takes a peak:

--

As previously announced, the theme of the 2002 Hamvention is Emergency Communications. In keeping with the theme, some of the highlights include Gordon West WB6NOA explaining how use of the Global Positioning System. Gordo will also show how it offers hams the ability to know where they are and describe where they are to better than a foot. That's very important information to have on hand when working an emergency situation.

But that's not all. Also on hand will be John Mc Hugh, KU4GY, the Coordinator for Amateur Radio National Hurricane Center, W4EHW. Mc Hugh will show the volunteer public service work of the gang at W4EHW, and the inside workings of the National Hurricane Center in Miami.

KU4GY will also detail two exciting projects called CARMEN and CWOP that they are working on in conjunction with NOAA. What are they? You will have to attend his session at Hamvention 2002 to find out.

Vermont's Mitch Stern, W1SJ, will also be there to talk on techniques used by the best operators involved in emergency communications. This session will also include information on the proper way to communicate during emergencies. Also hosting a session will be Mid-Cars on the importance of mobile to mobile and mobile to base communications are during emergency times.

Amateur Radio Newsline will also be there once again hosting the Live Town Hall Meeting. Bill Pasternak, WA6ITF, will moderate a session on Ham Radio Emergency Communications in the 21st Century titled Looking to Apply What We

Have Learned From the Past.

And also look for the most popular sessions including Carole Perry’s Youth Forum and Joe Eisenberg, K0NEB, with the latest in kits and how to build them.

This and a lot more happens May 17th 18th and 19th at the HARA Arena in Dayton Ohio. We will see you there.

For the Amateur Radio Newsline, I’m Don Wilbanks, KC5MFA.

--

Want to know more? The latest information on Hamvention 2002 is always on the web at www.hamvention.org. (DARA, ARNewsline(tm))

**

AMERICA AT WAR: RELIEF FUND GROWS FOR WTC VICTIM'S FAMILIES

A relief fund, established to benefit the families of the six broadcast engineers and technicians lost in the collapse of the September 11th World Trade Center has begun providing aid to the families of those killed in the terrorist attack. Amateur Radio Newsline’s Bill Pasternak, WA6ITF, has the details:

--

The Portland Oregon S-B-E electronic newsletter says that soon after its inception the S-B-E sponsored fund began drawing the attention of individuals and companies from across the country. And as of November 1st, almost $50,000 had been raised to assist their families of those who lost their lives in the collapse of the World Trade Center.

The fund that was started by the Society of Broadcast Engineers and the Ennes Educational Foundation Trust. Initial checks to the nearest family member of all six men were sent by October 31st. Eventually every penny off the money raised will go to the families of the victims. This is because the fund is all volunteer. There is no overhead of any kind involved and there is also no restriction on how the recipient may use the money.

In Los Angeles, I’m Biill Pasternak, WA6ITF, reporting for the Amateur Radio Newsline.

--

If you are interested in contributing, checks should be made payable to the Ennes Educational Foundation Trust and mailed to the Society of Broadcast Engineers, Inc., 9247 N. Meridian Street, Suite 305, Indianapolis, Indiana 46260. Mark your check to the attention of the Relief Fund. (Portland SBE)

BREAK 2

By telephone, satellite and the World Wide Web, we are the amateur Radio Newsline with links to the world at our only official website -

www.arnewsline.org.

**

TECHNOLOGY HONORS: FIRST ROTARY SPEED DIALER TO SMITHSONIAN

The developer of the first speed-dialer for rotary phones has finally been honored forty years after developing the unit. Pennsylvania inventor Vincent Iannucci spent two years developing the world's first speed dialer for rotary phones. The motorized device stored numbers and could dial up ten digits with the push of a button. It was nearly ready for the market in 1961, but production was disconnected by Bell Telephone Lab's after the development of touch-tone phones.

Iannucci put the prototype on his desk and used it until his own company changed over to the tone dialing system. He was going to throw it away recently, but a relative suggested he offer it to the Smithsonian. Now it's joining the museum's collection of electro-mechanical devices. (Science Online)

**

ELECTRONIC SAFETY: LIGHTING RECALL

A South Carolina lighting company has recalled over 10,000 fluorescent lights because they are improperly wired and pose a fire hazard. Progress Lighting, of Spartanburg, has received two reports of the fluorescent lights smoking and smoldering, according to the Consumer Product Safety Commission. No injuries have been reported.

The recalled fluorescent ceiling and bathroom lights were sold in various shapes. The label on the light contains the manufacture's name, the manufacture date, and a catalog number. Consumers are advised to using the recalled lights immediately and contact Progress Lighting. The company can be reached at area code 866-696-8593 between 8 a.m. and 5 p.m. EST Monday through Friday. More information is on the web at:
www.cpsc.gov/cpscpub/prerel/prhtml02/02036.html (Press release)

**

HAM RADIO IN SPACE: AMSAT ON-LINE SURVEY

AMSAT-NA has developed a new on-line volunteer survey, designed to identify the interests and skills of those who may be available to directly help in efforts to develop the amateur satellite program. The survey was developed by a committee led by AMSAT North America
Vice-President and Government Liaison Perry Klein, W-3-P-K and is designed to be completed and returned on-line and takes only a few minutes to fill out. To request the survey, simply send a e-mail request to volunteer@amsat.org (AMSAT-NA)

**

HAM RADIO IN SPACE: AO-40 UPDATE

A scheduled attitude shift that is necessary to compensate for unfavorable sun angles, will leave the Oscar 40 satellite's antennas pointing away from earth until next spring. The adjustments will lead to a transponder shut-down period that could start as soon as late December. The satellite is currently in a long period during which earth eclipses the sun near perigee - its point closest to earth. Like most satellites, Oscar 40 relies on solar panels for its power. (AMSAT-NA)

**

DX

In D-X, Eddie Seymour, WB4MLE reports a really neat opening on 6 to Europe the morning of December 5th. From 1400 to 1500 U-T-C, Eddie, operating from grid EM72 heard or worked SP, DL,YO, 9A, S5, ON, OK, 4N, G and GW. This, as 6 meters defies the experts and stays the D-X band that just won't quit. (VHF Reflector)

A new 2-meter propagation study beacon is being established at the Poldhu Amateur Radio Club in the United Kingdom. It is located 8 kilometers south of Helston in Cornwall and operates under the call sign GB3SSS will operate on 144.407mhz. Output power is 25 watts to two 8-element stacked Yagis beaming at 284 degrees. It is hoped to increase the power to 100 watts later. For further details please contact the beacon keeper, Mr. L Davey-Thomas, G3AGA, at his callbook address. (GB2RS)

Meantime, a bit lower in frequency look for the Council of Europe Amateur Radio Club. It plans to be on the air as TP5CE on the 14th to 16th of December, including the ARRL 10 Meter Contest. Outside the contest the main activity will be on all bands RTTY and CW. (GB2RS)

And PY8IT will operate as PYZ0FT from Fernando de Noronha between the 12th and 18th of December. He will concentrate on RTTY and PSK31. In both cases, QSL as directed on the air. (GB2RS)

**

THAT FINAL ITEM: AUDIO TIME TRAVEL

And finally this week, some words about time travel, Amateur Radio Newsline, our predecessor Westlink Radio and the audio history of ham radio since 1976. That's the year that Westlink Radio started to bring you the sound of ham radio from around the nation and around the world. And believe it or not, we still have almost every newscast tape we ever aired. In fact, we are in the process of archiving them and we have found a lot of moments that should not ever be forgotten. Moments like this from November of 1983:

--
Audio Here: W5LFL from space
--

That was United States Astronaut Owen Garriott, W5LFL, making the first ever manned ham radio contact from space. Its a part of our history as hams and as a nation and needs to be remembered. So for the next few weeks we will let you relive the time that W5LFL spent orbiting the Earth and making ham radio

history. Here’s how.

As you know we recently began providing our newscast audio as a downloadable Real Audio file from our own website at www.arnewsline.org. All you need to do is click on the newscast number at the top of the page to reach the FTP site. Now, when you go there, you will also find another audio file outlined in bright green. Its called the Newsline Extra and all you need to do is to click on the word download and it will soon be in your Real Audio equipped computer, ready to play.

In the coming months as we archive more and more of our older Westlink Radio programs we will try to bring you the best of them. Meantime, we hope you will enjoy this December 11th 1983 ham radio in space retrospective hosted by Amateur Radio Newsline’s Robert Sudock WB6FDF and featuring the story of ham radio space pioneer Owen Garriott W5LFL. (ARNewsline(tm))

Fixing up an NC-183D, original electrolytic was there and seemingly working well, but power transformer was running too hot to keep my finger on.

After disconnecting original electrolytic and substituting two new 47mf 450volt ones, power transformer seems to run much cooler.

Just FYI!

5154. FS Heathkit SB104 Station

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-15 16:24:17 UTC
From: Charles Hugg <chashugg@earthlink.net>
Message-ID: <ROKS7.4422$O7.461419@newsread2.prod.itd.earthlink.net>
Source record: 46648

I have for sale from an estate the nicest Heathkit SB-104 Station that I have seen. All gear was assembled by the owner's son who is great technician. His work is superb. The gear has not been used much and not at all in the past 15 years. All components and boards are original. Everything works fine except the digital readout on the SB104 flickers after it has been on for awhile. I think the gear needs some contacts and sockets cleaned.

1. SB-104 SSB Transceiver with SBM-104-1 Modification Kit installed;
2. SBA-1043 400 Hz CW Filter installed;
3. SBA-104-1 Noise Blanker installed;
4. SB-604 Accessory Speaker;
5. HP-1144 AC/13.8 Volt DC Power Supply;
6. SB-614 Station Monitor/CRT;
7. Heathkit Mic for SB-104. This is the later brown desk mic, modern design;
8. HD-15 Hybrid Phone Patch.

All equipment looks new and comes with original manuals. Gear will be double boxed and packed well at no cost.Price is $475 plus actual shipping costs from 79602 Thanks, Charlie Hugg, K5MBX

Well, sometimes you can get a shorted turn in the transformer too.
Usually indicated by low voltage out of the secondary. I have a
transformer that without load gets hotter than heck in a few minutes.

5162. Re: S-38 Questions

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-16 00:59:38 UTC
From: Bob <balbert@cnmnetwork.com>
Message-ID: <_ISS7.112891$C8.7978093@bin4.nnrp.aus1.giganews.com>
Source record: 46656
Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.boatanchors

There were several versions of the S-38. The S-38 had six tubes. All the others, S-38A through S-38E had five tubes. The five tube versions eliminated the tube used for BFO and instead used feedback around the IF amplifier. Sleazy. Early versions were gray. I think there was one black model and the E version was very different, with slide rule dials instead of airplane type as in the rest.

I remember reading the Hallicrafters motto, 'the radio that amazes the experts.' I consider myself a bit of an expert and I, too, was amazed. Amazed that they could sell such a radio and put their name on it.

Of course it worked, but was unstable and difficult to use for anything more than casual listening. Today's amateur radio operator would find it almost useless. But it has some charm, and there is nostalgia.

I remember the price too. The S-38 sold for $39.95 list. Later models were more expensive, due to inflation. I remember $49.95 and I don't know how much higher they went. They were about the same price as the Simpson 260 VOM.

Regards, Bob

Fritz -

Some useful links for further research (and ideas):

http://antiqueradio.org/halli08.htm

Here is an excellent web site for S-38 restoration notes. He even
demonstrates how he "recast" the knobs and notes that the rubber isolators
are absolutely necessary for a SAFE chassis.

http://www.concentric.net/~Stwradio/hals38.htm

http://www.concentric.net/~Stwradio/hals38.htm#Hallicrafters%20S-38%20Restor
ation

and more S-38 links !!
http://www.concentric.net/~Stwradio/hals38.htm#S-38%20Links

add an S-meter
http://antiqueradio.org/art/smeter03.jpg

http://antiqueradio.org/smeter.htm

The Hallicrafters Collectors' Web Site:
http://www.w9wze.org/

My notes on an internal isolation torroid transformer for the S-38

The UK audio designers gave me an idea to look at a toroidal transformer, as
a possible isolation transformer under the S-38
chassis.

I received and e-mail for Brian Gladstone, Director of Engineering at
Plitron Corporation in Canada
http://www.plitron.com

BTW S-38 draws 30 watts at 110 Volt according to specs

Plitron makes Toroidal transformers, and by my measurements one of their 50
VA units will slip right in under the S-38 chassis. You can mount it with
one screw (use the hole
for the old multi-section electrolytic).
You can select from a couple of secondary voltage (110, 117 vac) models.

Presto, same $ 35.00 USD price (thanks to CDN / USD exchange rates) as a
separate Stancor P6410 (50 VA rating), without hauling around an external
unit. Change AC cord to a polarized plug & fuse and you have a SAFE chassis

around children. A power switch, if desired, could be mounted on the back chassis (or rework the receive/standby switch on front panel).

I e-mailed to Bob Eslinger, KR1U and he would be interested in hearing from S-38 restorers who are using this approach Torroid transformers, due to their low profile, might be a solution for some of his antique radio restoration clients as well.

CC-AWA Winter Swap Meet.

Mark your calendars now, it's just over a month away.

January 26, 2002.

8AM til 12Noon.

The first antique radio meet of the new year.

Caughman Road Park, Columbia, South Carolina.

From I-77 go to exit 9 if you are coming from the south and exit 9A if you are coming from the north. Either way you are at US 378/76 EAST, also called Garners Ferry Road.

Motels at this intersection include:

Holiday Inn Express 803-695-1111
Days Inn 803-783-5500 or 1-800-325-2525
Hampton Inn 803-783-5410
Economy Inn 803-695-3485

To get to Caughman Road Park:

Go east on US378/76 from I-77 four point five (4.5) miles to the seventh (7th) stoplight, INCLUDING the one at I-77 and exit 9, but not the one caution light.

Turn left on Trotter Road and proceed one (1) mile. You will see the main entrance to the park on your left. DO NOT ENTER HERE.

Go to the next street on the left (about 200 yards), which is Caughman Road, and turn left. Go another 200 yards and there is a parking lot and a large covered picnic area on your left. This is the place.

We have this part of the park from 8:00 am until noon. PLEASE DO NOT ARRIVE BEFORE 8:00.

Looking forward to another great swap meet.

Tell your friends about it.

73,

Ron Lawrence KC4YOY
CC-AWA President

Funny, I have a NC-173 (slightly littler brother of yours), it now plays
perfectly, but the transformer does seem to heat up too much too soon.

The original 'lytic cap is still there, looking good. Do you suppsoe the
headlights in its rear view mirror say "Weller"? hi hi --Mike K. AA1UK

Good luck to the seller bad luck for any buyer - asking price seems to
be 8 times what they go for at auction in this country (Australia).
Maybe they are rarer in the US.

I assume it will get no bids!

I am looking for a marine shipboard medium frequency (400-500khz) radiotelegraph transmitter, any vintage, any condition (as long as it is complete enough to rebuild to operational condition). I would prefer a 60's or later ITT Mackay 2012A, if available, but anything will probably do. I would prefer East or Southeast locations, if available, to ease shipping costs.

Thanks

Bob/NA4G

Message-ID: <3C1E39DF.F74CE0D7@calpoly.edu>
Source record: 46690
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

For Sale:

GRC-106A Military radio station, consisting of:

RT-834 Transmitter Receiver, Continuous coverage of 2 - 30 MHz
AM-3349 200 Watt amplifier
MD-522A Modem

I have all the vehicle mounts, cabling, speakers, handsets, headsets, manuals, etc. for this rig. I do not have the teletypes, but they are commonly available. Station is all original (including orig. meters) and in excellent cosmetic and operational condition. I can provide pictures if you are interested. Beast would be a couple of hundred pounds all together, so pickup in central coastal California would be best, but I can ship it if you want to pay for it.

Asking $800.00 or interesting trade for tube gear (boatanchors or tube audio gear, quality tube tester, transmitter tubes or early Western Electric tubes).

Please email: dave@ragsdale.net

I suppose that you can provide EIGHT perfectly working RA-17s for $100 a piece. If yes please send them to me immediately,
if not please post your comments on the proper newsgroups. This group is strictly for trade, swap, auction and sales of
radio equipment and not for ambiguous idiotic statements from a country that the shipping costs are more than the cost
almost any item sent.

Message-ID: <dmoorman4-071BB3.17412417122001@netnews.attbi.com>
Source record: 46596

Overcome with nostalgia for a tube general coverage receiver, I bought an SX-100 yesterday. It's a little beat up and rusty, but came right up with the Variac and seems to work pretty good. It's plenty sensitive and the image rejection and selectivity are good.

There is some play in the bandspread tuning. When checking this out, I noticed that the dial cable appears to be metal and is frayed. Was a metal cable the original? What's the best replacement? Synthetic cable?

Thanks,

Dave K9SW

The price seems higher than going prices, but not 8 times higher. The condition of the receiver looks very good with
cabinet (I don't know if it is original one), so I want to say it is worth about $500. If it sells 8 times cheaper (which
is about $125) it will be gone in few minutes, and I wouldn't think twice to get it. I had one and sold it to my friend,
and it is a good receiver. It is a heavy receiver (shipping weight about 65lb), so the packing won't be easy unless shipped
on a wooden-skid. Paper box may not be adequate.

I think you are about the first person who has about the same opinion
of the s-38 as I do. A friend of mine had one of those back in our
beginning days of ham radio. Sure, it worked ok..That is until your
leg bumped the table. You would spend the next 5 min trying to find
the guy you were working...I found it almost useless even back
then."1970-1971" Overall, I hated the thing. He later got a
Halicrafters sx-40 or something like that from the early 60's. It was
much better. They also made a matching novice xmtr that matched it. I
see some that drool over those things,"s-38" but not me...I just never
could warm up to them. But I guess back in those days there wasn't too
much better for 40$ unless you built it yourself. MK

Do a yahoo or whatever search. Lots of places selling those. BTW, I'd
go for the 6146B instead of the 6146A. The "b" has 10 more watts plate
dissipation. "35w instead of 25w". I've never had any problems
replacing "a"s with "b"s so far. You be able to find either though.
Also the 6146W would work. MK

From: "David W. Fleming" <davefleming@novagate.com>
Message-ID: <u1umvjsbfeuq6d@corp.supernews.com>
Source record: 46611

I've got a wierd one. I have a NCX-5 with 6JB6 finals.
When I put them in the sockets and turn on the rig, they glow and go into to melt down.
I checked all the voltages with the tubes out and they are all within 20 percent.
I replaced the tubes with new tubes, and it does the same thing. (I don't let them get to the point of no return.
I have another NCX 5 to verify that the finals are in good shape.
Could the driver be at fault? Could it be oscillating at some random frequency, offering up enough grid drive to make the finals excite?
Well, any suggestions on this old boatanchor problem are well received!
Merry Christmas,
Dave/ NS8S

A recent posting here had a similar question. I believe that the cable
was originally metal. I suggested to the poster that he try getting cable
from a clock repair shop; another suggested a hobby shop. The poster
found that a guitar string - G I think - worked just fine.

What are your bias voltages with the tubes in? Screen, control grid,
etc? The Knight T150 had a pair of 6146's in the final with nothing but
grid leak bias, so when you lost grid drive, the finals glowed brightly
until they went dead.
If these look okay (especially grid to ground) and you suspect
oscillation, then replace the bypasses around the final both the
electrolytics and discs. BTW, I don't know how well the NCX-5 was
designed, but if it doesn't do this glowing into a 50 ohm load, then going
into a load of 3:1 or lower should not cause any oscillation under nominal
circuit conditions.

Dave:

If I understand, this runaway happens with the radio turned on but not necessarily in transmit mode? Or is it only when you key the transmitter on?

My first thought was insufficient bias on grid 1. But your voltage check would have disclosed this if it was the problem. You should have something like minus 60 volts in transmit mode and something higher (minus 100 or so volts) in standby mode. (These are estimates because I am not familiar with the NCX-5 in particular). Without enough negative bias voltage on grid 1, the tubes will conduct heavily and melt down.

If the bias is OK, and all the other DC voltages also, then a parasitic oscillation is the next thing to suspect. Inspect visually the parasitic suppressors on the tube plates and also take a close look at the neutralization capacitor. Look for obvious problems like opens or shorts.

If this inspection doesn't reveal any problems then start looking at the driver.

You might also hook the radio into a dummy load through an SWR meter or other indicator of RF power. Does the problem happen with a dummy load attached or only with an antenna? During the meltdown does the SWR meter show RF power coming out? Do the plate tuning and loading caps have any effect? Answers to these questions should tell you if you have parasitic oscillations.

Is this with the NCX in TX or RX mode? If only in TX, be sure the control grid bias is correct. I don't remember but some of the bias may be via grid leak action, and if drive is low or missing, plate current will be excessive.

BTW, what exactly do you mean by 'melt down'? Do the plates glow cherry red? Does the screen grid fry?

Dave, the only thing that I can think of that will cause your situation is bias, lack of bias..for the tubes to glow red and melt down, they would be drawing too much current, only way to draw too much current is to have NO BIAS,or low bias ..bias should be about minus (-) 50 volts on the control grids . be sure to check grid voltage with HV plate disconnected ..unsolder hv wire from power supply to transceiver. ,make sure it is in clear, go to transmit mode and read grid voltage to ground ,should be -50 ..trouble could be in minus power supply or in bias adjust pot or associated wiring.. Good luck Harold W4PQW

You may be thinking of the SX-140, which was matched by the HT-40
AM/CW rig. I have a nice HT-40, let me know if you want it.

Well, there were better-performing sets in that price range from
lesser-named budget mfgr's, and AIRC there was also enough high-end
surplus around in that price range to make us drool today. Forty bux
was a fair sum then - when even ART-13's were going for $26, sometimes
as complete and unused spares.

I saw a $600 bid, and then it went for the "buy it now" price of $750. Which seems to be about right to me -- Hallicrafters and Nationals and R390s and such sell in that range, when in the condition of the Racal.

If these rigs are going for $100 in Australia, mebbe we all should move to the land of the Kangaroo.

Hi have a swan 270 cygnet about 7.5 to 8 appearance wise. Works really
good have mic with it and power cord also copy of manual.
looking for a Drake Tuner.
thanks
Chris NI4L

5236. Wanted: FT-101

As Skid mentioned, I had a similar (?) cable in a signal generator.
In my case, the cable had to be solder-able. If you decide to use
a guitar string, and it needs to be soldered, be sure to get a
phosphor bronze metal string. If you get a phosphor bronze nylon
string, you can't solder it. You must specify phosphor bronze in
addition to specifying a metal string to get what I got. They
come in various diameters, in accordance with the note they
get tuned to.

hello,

i have a drake tr4c. this radio is a solid 9 out of 10. 200 plus watts out on all bands except 15 meters. no receive or transmit in that band alone. the radio does not have the crystals for the lower part of 10 meters. includes ms-4 speaker/ac4 powersupply in same condition. no letter rubs, bad scratches etc. the radio plays as described above, but due to it's age is sold as is. comes with original manual. no mike or key. does not have noise blanker installed. i would be happy to send pictures of this radio as it is the cleanest drake i have ever owned.

i want a solid state rig for digital (rtty psk etc) work. i am preasently using my heath sb-101 and it just is not getting the job done. looking for a kenwood ts-130s, ts-180, ts-430 or ts-440. or email me with what u have to trade and we can deal. do not really want anything hybrid (tube final) as i am tube poor with radios right now.

cash price outright $325.00 plus shipping. lower 48 states only. everyone else drop me an email and we'll discuss it.

73 and tnx
mike prevatt

Message-ID: <2rXT7.943$PO5.134297@newsread1.prod.itd.earthlink.net>
Source record: 46636

I have just got one of these radios, and admit to being an idiot in that I am wondering about the two position switch which is controled by an knob located *inside* the radio, on the chasis top side, at the rear, on the left hand side? Ok its a voltage selector but there is no label to indicate which way the switch is thrown for normal voltage(s) operation?

This particular SW-3 is powered by 5 external wires (blue green yellow red black), i.e. it is a series I SW-3, also known as series 10-12, and uses 32, 32, 30 tubes. I don't know whether to turn the knob clockwise or counter clockwise to set the voltages to normal DC voltages where you would have 67 and 135 B+, -3 volt C, and 2 volt A ??

Thanks for any help here.

Hi

Just to expand on my previous posting, when I suggest $125 is the
local Aust rate, that is on a bad day at a general weekly auction with
a few other collectors around - should go for less normally.

ebay prices are of course many times higher, so it pays to look around
your local general auctions unless you want to pay top dollar and need
it NOW. I trust I am not giving collecting secrets away. Note that
particular models don't come up to order - some weeks nothing, others
several interesting collectable radios.

Obviously shipping would render buying here from the US uneconomic,
but the similar auction sources should be available in most western
countries.

A previous post suggested this group is for FA FS etc but I think you
get spammed for that:-)

If it's any help there is a print of other schematic at

ftp://bama.sbc.edu/downloads/national/sw3/pages/SW3PG3.JPG

as well as other pages of the manual. It doesn't say which way to turn
it other than "turn it to 6.3 V or 1.4 V." It sounds like your labels
are missing.

You could probably trace it out by looking at the print and the switch
and determine which position is which.

It's for the filiment voltage. I don't believe it changes the B+.
Back then a lot of radios were sold without tubes to allow a rock
bottom price. Depending on which tubes you bought you might want
2 volts or 5 volts for the filiments. The B+ would be the same for
either type tube. Hook the batteries or battery eliminator up with
the tubes out and measure the filiment voltage at the sockets with the
switch in both positions and you'll know where to set it. Good luck.

Interesting, the going rate for a good RA17 in the UK is about 150 to
200 UK pounds for an L model and say 75 to 125 for an earlier one. It
isn't as though they are scarce. Why is the price so high in the US? I
know US models were made and exported also I believe that a fair number
were sold to Canada.

Yours bemused

Well done! Wish I I had thought of that great solution!
I have a dog house power supply that probably was used for a
radio like that. It has a huge resistor and sliders to pick off
the various different plus voltages.

5255. RL1 for TS-520?

Newsgroup: rec.radio.amateur.boatanchors

Hi All,

Can someone tell me where I might be able to get a replacement relay
(I think its RL1; its in a small clear plastic box and resides next to
a couple of big capacitors) for my TS-520?

Any help would be appreciated.

Bob

If he checks his schematic or looks at the wiring, the screen may be fed
through a screen dropping resistor from the plate supply. Most, but not
all rig schematics I've seen do this so that if plate voltage is ever
lost, the screen goes to zero at the same time.

I just picked one of these up and it doesn't seem to work with my ICOM 735. Is it too old to be used with newer rigs or is there something wrong with it? If it's too old, then is there anything I can do to modify it to work with the 735. Any replies will be appreciated, and by the way, if you are replying to my email address, delete the "REMOVETHIS" before you send or it won't work.

Thanks, ERIK KK7OA

Most of the comments sent your way on this were pretty good. Another question is whether the runaway is very fast (eg. a few seconds) or after tens of seconds. I think control grid bias really has to be the culprit, but to measure that bias you need to carefully measure with a high impedance VOM _THROUGH A RF CHOKE_ of say 2.5 millihenry or so to keep your meter leads from detuning the input AND keep rf out of the meter. Also, for some pentodes, plate current can be very sensitive to screen voltage, too. I had an audio amplifier where the screen voltage was just about 20% high and those tube plates started to glow a dull red after tens of seconds.

Another clue might be to use the same metering techniques on the good NCX-5 to see what the comparable voltages are. You could have a couple of other crazy things going on.

Also, do you have a schematic to help you trace things down. If not, you may have to draw one from examining the actual wiring out to one or two components away from the tube.

That is correct for most class C type finals that are used for CW or AM. But this is I believe a SSB rig. It would be rare for the screens to be fed from a dropping resistor from the plate supply. In a SSB transmitter the screen voltage needs to be held stable while the screen current changes with drive to the tube. Most SSB transmitters get their screen voltage from the low voltage supply that supplies the low level stages of the transmitter.

That wasn't a stupid question by the way, quite reasonable. The doghouse power supply was -probably- made for an HRO so it would have plenty of power for a little SW-3. The SW-3 is a really neat set. They called it the Thrill Box. Many a ham got his or her start with one of them. Good luck with it and have fun. Merry Christmas Gary N9ZSV

The early doghouse supplies were for the FB-7 - and also sold/used
later for the 2.5v HRO's unchanged (i.e., still labelled for the
FB-7). If he uses the 2.5v tubes, then, this is the doghouse supply
he would wish to use (if he wished to use one).

5279. Modulation Transformer Feedback

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-20 23:59:43 UTC
From: Tony Angerame <tangeram@lucent.com>
Message-ID: <3C227B6F.15359FBE@lucent.com>
Source record: 46573

I have a B&W 5100 that is giving me some fits. After modifying the audio chain, adjusting screen voltage, replaced all tubes, adding additonal capacity to the plate supply, neutralizing and replacing all the black beauties I still have scratchy audio. I noticed the other night that it is hard not to overmodulate and that there is still some feedback even after tightening the mod transformer bells. I extended the mic cable with a 12 footer and had the xyl talk at it in the garage (On the dummy load of course!) while I observed the scope in the shack.

No overmodulation now! Nice clean scope pattern. So what's happening is that the talkback (I think at hifreqs) is causing feedback in the audio chain. The feedback seems to occur at ornear 100% modulation and causes an occasional peak to show up as overmodulationon the scope. I have even tried using peak limiting (low level) and
comprression and it still appears. Bringing the mic even two to three feet away from the transmitter causes a loud howl.

Is there anything else I can do to avoid this feedback? The modulation transformer seems to be a rerun of the original. Newly painted. Maybe a Peter Dahl I don't know. The guy that sold it to me said it had a new modulation transformer, followed by a slight chuckle.

Your assistance is greatly appreciated!

Tony WA6LZH

Maybe you've already tried, but how 'bout a different mike or different length mike cord? Does it happen on all bands? I'd bet on RF feedback somewhere/somehow.

Wrap three or four turns of the mike cable around a RatShack
split-core ferrite "toroid" (rectangular, with square x-section),
close to the mike connector, to try to keep the RF out of the
mike and cable?

Would like to buy, or trade for, an FT-154 Mounting Base for the U.S. Army Signal Corps, BC-348, HF Aircraft Receiver. These were used in B-17 and B-24 aircraft during WWII. Any help appreciated. Thanks. Gary

Some mike cable is not shielded very well for RF. Try another mike cable or different mike. You can also put a small RF choke in series with the mike jack in the transmitter. Bypass the connector to ground with a 100 to 220 pf cap. That should get rid of the rf if that's the problem.

Also in doing all the modifications you may need to put a .002 or so cap across the mod transformer that was probably there to start with. I don't know if there is any feedback circuit in the audio chain but if there is the cap across the transformer may help. Sometimes you have to limit the bandwidth when using feedback circuits.

Tony, how did the rig sound before you did the modifications? I also have a B&W 5100 , I looked into these various modifications and I can`t see any need to modify something that works and sounds as good as my 5100 ..maybe you might want to put it back like B&W had it originally. they had some pretty good engineers,you know.. just a thought, good luck . Tony...I would take a hard look at the replacement transformer. It's entirely possible that there is an impedance difference from the original. I have seen this often when folks try to 'make a better mousetrap'. Having had several B&W 5100B and others, most that I bought new, I can tell you that all things being equal, you won't beat the audio with anything in it's day. (except for the 32V2/3)

Son of a gun!!! I missed that.. Most of the units I've worked on had
clamps,
not soldered cables. Whatever.

Wes, I think any ham looking at the list of suggestions offered could
probably figure
a means to make **any** of them work, using the materials available,
without too much
effort. It wouldn't be too hard to add a crimp sleeve over a stainless
steel cord
to allow soldering.

73

Pete

BTW, did you work the P5? Wasn't to strong on the east coast.

I have an old national 3w-54 sitting over on the other side of the
room. It's kind of like a general coverage S-38. I've had the thing 10
years, and I still have never plugged it in to see if it works... I'd
rather listen to my old 1958 transoceanic than that thing I think. I
used to have a 51?? T/O and it was even better. Great for AM-BC.

Yep, thats what it is. He still has it I think. He used it with a
DX-40 heath xmtr. I had another friend that had the HT-40 with a drake
2C. I don't need the HT-40 here, as my tube rig days are about over I
think, unless it's something good like a drake or collins. But I'll
pass it on to the guy with the SX-140. I've still got some old drake
gear, but thats about it as far as oldies. I hardly use them any more
but they still work. Hate to get rid of them as I've had them quite a
while. Old rigs are fun, but I'm too picky about drift, readout, etc
these days to use them on an everyday basis. I had to get a VFO-230
just to be able to tolerate a TS-830. It's internal VFO drifts with
temp changes. It's solid as a rock with the vfo-230 though. MK

Give me a heads-up before you submit an old Drake to the cruncher.

Tony:

I believe Heath had this problem with the DX-100 transmitter at least in the one I had they put a 0.001mfd ceramic capacitor across the output of the modulation trasnfromer to cut off the high frequency peaks. I think the cap was rated to 3KV because it had to withstand peak to peak maximum audio voltage.

That may be what you're hearing

AMATEUR RADIO NEWSLINE(tm) REPORT #1271 - DEC 21, 2001

Amateur Radio Newsline report number 1271 with a release date of Friday, December 21st, 2001 to follow in 5-4-3-2-1.

The following is a Q-S-T. A national ham radio society is asked to train new hams for government service. This story is first on this weeks Amateur Radio Newsline report number 1271 coming your way right now.

(Billboard Cart Here)

**

THE EDUCATION SCENE: HAM TRAINING LEADS TO SA GOVERNMENT JOBS

A government agency has asked a national ham radio society to help train new hams. The reason. careers with that agency. Its happened in South Africa as we hear from Q-News Graham Kemp, VK4BB:

--

In South Africa, their Department of Communications contacted the SARL with the request to train seventeen post graduate students as amateur radio operators. These students had already qualified in different fields, some technical and some in the Information Technology fields. There were nine ladies and eight men. From next year they will be employed by the Department of Communications, and the idea was to give them some experience in the field of radio communications.

Training was done by Henry Chamberlain, ZS1AAZ, over a period of one full month. In addition to lectures, the students could see practical demonstrations of amateur radio and they spent one period building and testing a Morse Code practice oscillator. They also visited ZS1AAZ's home shack. The seventeen students had already proved their ability by passing their previous studies successfully. It was therefore no surprise that they ALL passed the amateur examination.

For the Amateur Radio Newsline, I’m Graham Kemp. VK4BB, of Q-News.

--

The seventeen will be assigned specific jobs with the South African Department of Communications in early 2002. (SARL, Q-News)

**

SPECTRUM SHARING: FCC SAYS YES TO HIGHER POWER UNLICENSED TRANSMITTERS AT 2.4 GHZ

The FCC has approved issued new rules permitting certain unlicensed Part 15 devices operating between 2405 and 2450 MHz to use higher power, but under significant restrictions. The band is allocated to amateurs on a co-secondary basis. Amateur Radio Newsline's Norm Seeley, KI7UP, takes a look at the FCC action:

--
According to the C-Q Magazine website, the decision was adopted on December 11Th. In it, the FCC approved a petition by Sierra Digital Communications, Inc. to permit unlicensed fixed point-to-point transmitters in the band to operate at field strengths of up to 2500 millivolts per meter. This is a tenfold increase over past power limitations.

Sierra Digital Communications manufactures and sells equipment for wireless data communications, including high-speed wireless computer networks and Internet links. The ARRL had opposed Sierra's petition on the basis of increased risk of interference to amateur and amateur satellite operations. This is because the downlink from the AO-40 satellite is in the 24 GHz band.

But the FCC said it believed the restrictions it is imposing on the higher-power transmitters will provide sufficient protection to other users. This includes industrial/scientific/medical equipment, radar and Earth exploration satellites, in addition to amateur radio. The new rules require highly directional antennas and high frequency stability of transmitters.

For the Amateur Radio Newsline, I'm Norm Seeley, KI7UP.

--

In its decision, the FCC singled out an ARRL comment where the League clamed that Part 15 devices are permitted by the Communications Act of 1934 only where they have no interference potential to licensed services. The Commission called the League's interpretation of the law overly conservative. It said that its rulings to date appropriately provide a means for allowing unlicensed devices to share spectrum with licensed services with little risk of interference and adequate protection to licensed service. (CQ)

**

HAM RADIO AND THE WAR: MARS ON THE AIR FROM THE WAR ON TERROR

Ham radio is making it possible for those fighting the war against terrorism to phone home. This as the ARRL Letter announces that Army Special Forces on duty in Islamabad, Pakistan, and in other undisclosed locations have begun keeping in touch with home via MARS -- the Military Affiliate Radio System.

Phone patches provided by the Military Affiliate Radio System make it possible for troops to call their families in the US from areas where commercial communications channels are not available. Amateur Radio operators enrolled in MARS provide the connection between the Military Affiliate Radio System stations deployed overseas and the telephone system back home.

During the Vietnam War, phone patches were a major source of comfort to families and service members alike. MARS also responded during Operation Desert Storm. (ARRL)

BREAK 1

Wishing you a Happy Holiday from the United States of America, we are the Amateur Radio Newsline, heard on bulletin stations around the world, including the Great South Bay Amateur Radio Club repeater, W2GSB, serving West Babylon New York.

(5 Sec Pause Here)

**

HAM RADIO AND THE WAR: GODDARD ARC FEELS THE PINCH

The Goddard Amateur Radio Club says that it has been having serious problems with manpower lately and the war on terrorism is partly to blame. This is because new security restrictions imposed after September 11th require all visitors to Goddard to be escorted by a badged employee at all times.

According to Dan Schultz, N8FGV writing to the Amsat Bulletin Board, the clubs WA3NAN ham shack is located on government property we are bound by the new restrictions. This says Schultz makes it much harder to bring in control operators who are not Goddard employees. As a result, WA3NAN which for years has been the primary rebroadcaster of shuttle communications on the ham bands is not there as often as it would like to be.

Schultz also notes that the Goddard Amateur Radio Club currently has no president because no one has stepped forward to accept the job. The position of Shuttle Retransmission Director is also vacant, this is the person who makes the phone calls to get operators lined up to pull shifts at the retransmission facility.

Schultz says that the long term technical solution will be to automate the station with remote controls and telemetry for the transmitters so that the retransmission operator can operate from his home. But adds N8FGV, but that is still a little ways off in the future. As a result, WA3NAN is not there as much as it used to be. (AMSAT-BB)

**

AMERICA AT WAR: NEW HOMELAND TERRORIST ALERT SYSTEM PROPOSED

Homeland security chief Tom Ridge is considering a multistage system for terrorism alerts. Ridge is also weighing how to reimburse states for the costs of increased security since the terror attacks.

Since the September 11th terrorist attacks on New York and Washington, Ridge has issued three general warnings. None of the alerts identified specific targets.

Now, according to news reports, Ridge will propose a four-stage Threat Alert Network similar to the military's DEFCON'' system. DEFCON alerts military personnel to the seriousness of a threat. A private sector version would be aimed at helping state and local law enforcement personnel determine the level to react to a Federal government issued terror warning.

The proposal came to light after California Governor Gray Davis met with Ridge about a week and a half ago. Davis told Ridge he had proposed such a similar system for California, and said Ridge had asked him to wait pending a national model. Ridge told Davis that he hopes to unveil the national system by January 15th of 2002. Whether or not ham radio will play any part in such an alert system is not known as we go to air. (Published news reports)

**

AMERICA AT WAR: CONFERENCE HELD ON ALERTING THE PUBLIC

Still in there area of alerting the public, more than 120 leaders from the emergency warning community met November 30th and unanimously called for the creation of a public-private partnership. This, aimed at improving the delivery of timely and accurate emergency information to people at risk. Don Wilbanks, KC5MFA reports:

--

The group came together at a special conference arranged by the National Warning Organizing Committee. This is a group of emergency warning advocates representing the public and private sectors.

Those attending included federal, state and local government officials, not-for-profit organizations, and representatives from the private sector. And in the end the group has tasked itself to improve the delivery of warnings and emergency information to the public. This, through better education, research, standards creation and policy recommendations.

The Committee Chairman is David Liebersbach, Director of the Alaska Division of Emergency Services. He has appointed Peter Ward, formerly of the U.S. Geological Survey and chair of a White House-appointed working group on natural disaster information systems, to head up a committee to determine the new organization's structure and governance. Ward also serves as the new organization's spokesman. More news on the work of this committee as information is released.

For the Amateur Radio Newsline, Don Wilbanks, KC5MFA, in New Orleans.

--

The conference was hosted by The MITRE Corporation in McLean, Va. MITRE is a not-for-profit national technology resource that provides systems engineering, research and development, and information technology support to the government. (MITRE)

**

HAM RADIO AND EDUCATION: HAM RADIO MASS BALLOON LAUNCH

The Timberlane Regional High School, in Plaistow New Hampshire will be taking part in a high altitude experiment next spring. This with an announcement that the Coordinated Algebra II and Physics classes taught by Lorainne Mascioli, N1VYQ, and Lou Broad, N1RCA, are planning thier third year of ham radio and high altitude balloons in May of 2002.

Six student teams will attempt to launch their balloons at the Hosstraders Ham Fest at the Hopkington Fair Grounds in New Hampshire. Each team is responsible for design, construction, and operation of their system. Each balloon will carry a GPS receiver, a packet reporting system and several experimental payloads. This could include cameras, video, amateur television and cross band repeaters. At maximum altitude such systems will have a range of 300 miles and should easily cover all of New England and more.

The class has grown to 34 students and they are planning to launch six balloons in a two day period! This could make it a record breaking event in both ham radio and high altitude ballooning. For more information check out the CAPSAT Website located in cyberspace at
http://www.mv.com/ipusers/llb/capsat.html (Via Internet)

**

HAM RADIO SPOTLIGHTED IN POUGHKEEPSIE JOURNAL

New York’s Poughkeepsie Journal has highlighted ham radio in a December 6th front page article. The piece focused on the public service aspects ham radio with quotes and pictures.

According to Andrew Schmidt, N2FTR, who is an ARRL Assistant Director in the League’s Hudson Division, many Poughkeepsie area local hams spent time at Ground Zero or at the Red Cross centers in the greater NYC area following the September 12th terrorist attacks. Andrew says that their work is well highlighted in the article. The link is:
http://www.poughkeepsiejournal.com/thursday/community/stories/co120601s12.

**

A SPECIAL AM EVENT: THE HEAVY METAL RALLYE

This is Paul Courson WA3VJB with news of an operating event Saturday night, December 22nd. It's the Heavy Metal Rally, featuring big iron, vacuum tubes, and the warm and inviting sound of AM on the shortwave ham bands.

Starting around local sunset listen for rigs in the 250 watt or 250 pound category to populate AM gathering points on 160, 75 and 40 meters.

Jim, W8MAQ was testing HIS 1947 Collins 300-G a few days ahead of the Heavy Metal Rally. The retired broadcast transmitter re-tuned to 75 meters sounded like this:

In-Q: it's been great to get on... 300-G..
Out-Q: forward to that

--

Prizes include a trophy, pictured as a posting on QRZ.com, for the best sounding station.

Last year more than a hundred stations took part -- and the winner was Mike, WN3B, on a Gates 250-C. He gave Jim an audio report the other night:

--
In-Q: It's got more highs....
Out-Q: Shure 55
--

The Heavy Metal Rally is sponsored by Electric Radio, a magazine featuring vintage ham radio, and published by Barry N6CSW. The event was pioneered by Bill, KD0HG of Colorado, a broadcast engineer with a knack for big homebrew rigs that sound great.

Frequencies and a website are listed on the news page of QRZ.com.
Paul Courson, WA3VJB, Annapolis Maryland.

HAM RADIO HISTORY: COLLINS RADIO CENTER NOW OPEN

The new Collins Radio Center which is the headquarters for the Collins Radio Association is now officially open for guests and visitors. Located near Johnstown, Pennsylvania, the Collins Radio Center includes a representative collection of Collins radio equipment, from the 1930's to the present. There are other classic and antique radios on display as well. More information is on the web at www.collinsra.com. (Collins RA Press release)

**

HAM RADIO BUSINESS: CITY ELECTRONICS - RIP

Alex Stalinsky, WA5UHT, who owns City Electronics, a small parts outlet in Houston for almost 50 years, has decided to call it quits. According to Chris Boone, WB5ITT, this place was one of the main sources of parts, components in Houston long before the likes of Mouser and Digikey took off in mail order sales.

Chris tell Amateur Radio Newsline that he bought many parts from City Electronics in his early days of repeater building. In fact, Chris says his mother claimed that he owned half of the local Radio Shack but she was wrong. It was really like he was a part of City Electronics as were many other young Houston area hams and Chris tells Amateur Radio Newsline, it will be missed. (WB5ITT)

**

EMERGING TECHNOLOGY: INTELS NEW WARP SPEED CHIP

In another step toward faster computers, Intel Corp. has developed two new technologies that will help the tiny transistors inside microprocessors run cooler, use less power and operate more efficiently. The new designs

complement several recent breakthroughs in building minuscule transistors that form the basis of all modern computing as they switch on and off billions of times a second. Earlier this year, Intel unveiled transistors just 20 nanometers wide. Today's Pentium 4 has 42 million transistors, each about 180 nanometers. For reference, a manometer is about 10,000 times narrower than a human hair. (Intel)

**

EMERGING TECHNOLOGY: DTV ROLLOUT UPDATE

Roughly two-thirds of commercial television stations plan to broadcast a digital signal by a federal government deadline of May 1, 2002. This, according to the National Association of Broadcasters.

In a report to the Federal Communications Commission, the industry group said that many of those that won't make the deadline are waiting for equipment to be delivered and expect to have digital broadcasts on the air in the months afterward. But some stations in smaller markets are having a hard time paying for the upgrade, the association says.

Right now, most home television sets in use receive only analog signals. But congress has mandated that broadcasters must give up their analog channels to the government by 2006. As a result, there are concerns that consumers won't have made the costly upgrade to televisions that can receive digital signals by that date. (Broadcasting Daily)

**

HAM RADIO IN SPACE: EXPEDITION 4 CREW NOW ON THE ISS

An all ham crew is now in charge of the International Space Station and will be for the next six months.

Three astronauts and cosmonauts now running the ISS. They are Russian Commander Yuri Onufrienko, RK3DUO, along with American Flight Engineers Dan Bursch, KD5PNU, and Carl Walz, KC5TIE. They make up what is called the Expedition 4 crew and all three are expected to be on the air regularly for school contacts and possible open QSO times made available to talk with hams worldwide, as time permits.

The Expedition 3 crew comprised of United States Commander Frank Culbertson, KD5OPQ, along with Russian Flight Specialists Mikhal Tyurin and Vladimir Dezhurov is now back on good old Mother Earth. They returned on Monday, December the 17th aboard the space shuttle Endeavour. (AMSAT-NA, ARISS)

**

HAM RADIO IN SPACE: EDUCATIONAL ASSISTANCE FROM VK5ZAI

Attention educators. If you are thinking about teaching the International Space Station, here is a bit of assistance.

Tony Hutchison, VK5ZAI has updated his web pages with links to help schools in obtaining educational programs associated with the I-S-S and space science in

general. Hutchison says that this should be of interest students and teachers alike especially if they are contemplating applying for a ham radio contact with the astronauts on the station.

Hutchison is the Australian ARISS Coordinator. His website in cyberspace at www.electric-web.org (VK5ZAI)

**

SPACE AND SCIENCE: CHINA ON THE BRINK

Space Daily reports that China is getting ready to launch its third unmanned spaceship. This, to pave the way for sending that nations first astronaut into space sometime next year. China is reportedly also in final testing and preparation to launch a new satellite dedicated to study ocean colors and related phenomena. (Space Dailey)

**

DX

In DX, 9V1YC reports that he and eleven other hams will be activating South Georgia and South Sandwich Islands in January and February of 2002. The operation will be strictly on the high frequency bands. Exact dates, call signs and QSL managers are not being made public until the group is actually on the air. The New Zealand registered vessel "Braveheart" of ZL9CI fame will be supporting this team for the entire 30 day trip. (RSGB)

A bit higher in frequency, Jeff Klein, K1TEO reports that December 6th was another great D-X day on the 6 meter band. Jeff who lives in Connecticut says over the VHFReflector that the band was open for a solid two hours beginning at 7:30 am local. And talk about D-X. On his very first C-Q he landed HB9QQ who was operating portable HB0. Even better, Jeff says that the fifth caller was 4X1RF. (VHF Reflector)

Over in Great Britain hams are actually D-Xing for charity. Jeramy Boot G4NJH, reports from Nottingham in the U-K.

--

Every year in September, the British Wireless Fund for the Blind -- a registered charity - organises a fund-raising event in which amateur radio clubs and individuals are sponsored for the number and distance of the contacts that they make. As of the 11th of December, the British Wireless for the Blind Fund reported that 'Transmission 2001' had raised £6681.48, with more coming in every day. They say that they hope the final total will reach £7000. The charity offers prizes to the club and individual raising the greatest amounts.

This year the Cray Valley Radio Society operating as GB2FB and taking part for the first time, won the prizes for the club raising the most money and for making the most contacts. Robert Guscott, M5GUS, operating as GB0WB, won the prize for the leading individual.

Jeramy Boot, G4NJH.

--

The bottom line. This is another way that hams can not only enjoy their hobby, but can help others at the same time. (G4NJH)

**

THAT FINAL ITEM: A HAM RADIO CHRISTMAS STORY

And finally this week, the story that we wait all year to tell you. Its the ongoing story of hams who care about hospitalized children and what they do to bring a bit of holiday cheer to those kids who cannot make it to the mall to spend a few moments with old Saint Nick. Here’s Amateur Radio Newsline’s Joe Moell, K0OV:

--

As most hams know, propagation is very good this time of year. It's so good that it's easy to make contact with the North Pole. Many clubs around the country are taking advantage of these propagation conditions to set up QSOs with a very special North Pole station. They're making these contacts from hospitals and rehabilitation centers, and they sound like this:

--
Santa and Kids Audio Here
--

That's what the North Pole Network sounds like in southern California, where it's celebrating its 25th anniversary at Childrens Hospital of Orange County. In the past few days, I've heard from other clubs in the North Pole Network, including the AkSarBen ARC in Omaha and the Southwest Missouri ARC in Springfield. And YOUR club could bring holiday joy to hospital patients. There's a how-to article on the subject, with a dozen suggestions for your best North Pole Network ever, currently running on ARRL's Web site. That's arrl.org, of course. And there's even more about North Pole Network in southern California, plus lots of photos showing a quarter century of holiday fun, at the Hospital Disaster Support Communications System Web site, www.hdscs.org. Check it out, and start planning for your own North Pole Network joy.

--
Santa And Kids Audio Here

5333. Neeb 8 volt fuse looking bulb

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-23 19:00:01 UTC
From: Marvin Born <mborn@k8xu.com>
Message-ID: <3C2629B1.AE0350D3@k8xu.com>
Source record: 46526

Gentlemen,

I need a box of lamps that looks like a 3AG fuse, 8 volts, (
1- 1/4 inches long by about 1/4 inch.) The only marking are
"8 Royal" they were made by Royal (now Phillips) and were used
in 70's era stereos. I understand there was a 6 volt version
which I can also use. The unit uses a total of six and all are
burned out.

I have already tried Antique Radio and they are out of stock.

(connection to radios? Its the amp for my R 390)

does anyone know of another source?

73, Marvin
K8XU

5334. Need manual for Polycom 6

Source record: 46527

Geneltmen,

I have a Polycom 6, six meter transciever from the late 60s / early 70s. I need a manual or a copy or anything that has a circuit drawing. (This is a relative of the Polycom 62 but only 6 meters.) It has too many problem to fix without some paperwork.

I have tried 1-800 807-6146 and they do not have one listed. Does anyone have a manual they will be willing to copy?

73,
K8XU

There's a zillion vendors on the web...here's one link.

>http://www.rpelectronics.com/Default.asp?Main=/English/OnlineCat.asp?Menu=/English/Content/Categories/CatM_43.asp%26Detail=/English/Content/Items/FUSE8-250-2.asp<

Just type in "fuse lamp 8v*" (without the quotes) on Google and you'll
find plenty. Often I see some of these sellers on ebay also.

Mouser (www.mouser.com) carries the line but last time I needed one they were indefinitely back-ordered which is not at all like Mouser to do. Its worth a try to see if that situation has cleared up. Search 'jones plug' on their site.

Hello all
- This will be old hat to most of you folks. I have acquired a hallicrafters S-22 Skyrider Marine. I did the usual pre-plugging in checks (too old and slow for quick unplugging), then fired it up. I could feed RF all the way thru', but couldn't rec'v anything. I put my scope on the grid of the oscillator tube and got nothing. As I rotated the band switch to check whether the oscilator would work on any of the bands, it started to work intermittently on them all. I CLEANED the switch contacts. I guess cleanliness is next after filter cap's. The radio now works, and needs an alignment. The IF's had been tuned to 1700kc instead of the correct 1600kc.

- For this radio, (and I will also post this request to the antiques group), I need the two trim strips which go along the sides of the cabinet.. I also need a GOOD picture so I can match the paint colour - color - culler - whatever! Any help would be greatly appreciated.

- MERRY CHRISTMAS & HAPPY HOLIDAYS to all and may the new year bring only challenges of the hobby type to your life !!

Hi All,

I have a TS-520 with the 500 Hz Kenwood CW filter installed and am considering purchasing the International Radio 250 Hz filter. It occurs

to me that it may not be too difficult to modify the radio to accommodate
both, so that I can switch between one or the other, or perhaps, run the two
in series.

I would appreciate hearing from anyone who can offer suggestions and or advice on this matter.

Thanks and Happy Holidays.

Bob

It scared me away. I have been looking for a nice KWM-2A, but didn't
want to get involved with that much hassle. It made me think there was
something wrong with it. The price was OK, but not the text.

Seasons Greetings!

I have a Heathkit HW-22A for trade. It's in good condition, but I don't have the manual anymore to hook/wire it up. I tested it out about a year ago. I have spare NIB finals for it. I was going to put it in my truck, so I acquired the matching mobile mounting bracket and an HP-13 power supply. I also have a NIB 40 meter whip antenna. My son now has my truck, so no mobiling for now.

I'm in the Dallas area. I'll trade it for parts/electrolytics and/or tubes (nice stuff only).

73, Gary K5QT

Source record: 46450

-- Hello

I've noticed the SSB mechanical filter in my JRC515 receiver has developed
a very high insertion loss.

Can anyone advise if replacement filters are available, and from who? Or,
if the problem is being caused by foam in the filter deteriorating over time
(a common problem in some 1960s mechanical filters from Japan).

Grove, Universal and FoxTango don't seem to carry filters for the '515.

Thanks

Peter

yep- stuff like this is a killer--

Buyer pays shipping, insurance, packing and shipping materials.
I personally Do Not ship, all sales FOB Umatilla FL.
I will arrange shipping for you by a shipping service.

He also would have supplied the shipping charges for anyone if
they provided the zip code. You also have the option of requesting
the seller to provide a phone number so you can talk about your
concerns. I think the seller was being forthright, he stated his terms
in the auction. His feedback could be a tad better.

It's been my experiance that negative Ebay feedback totaling
more then about 2% of total feedback postings mean you're
likely to have at least some level of transaction difficulty with
an individual. One or two percent seems to be the "couldn't please
them if you hung'em with a new rope" bunch, or the "loonies."
What do you think?

I got my first negative (out of about 300) the other day after giving
one of the few I've ever passed out. Auction ended 10/13 and I had been
dogging the guy to send my stuff after about 5 weeks with no response.
On 12/4 I threatened the negative feedback if he didn't at least respond
within 24 hours...and he didn't so I posted it.
Well, it only took him a few hours to respond in kind. The item arrived
today 12/24. It was postmarked the day I sent the feedback. His
negative comment stated it had been shipped and blamed it on my
impatience and the Christmas rush.
He still hasn't collected the money for it though. What a disorganized
goober!
-Bill

Soon after I got mine, I modified the fixed channel switch to switch
the CW filter in and out of the circuit.....very handy at times. I'll
bet you could do the same thing.....unless you use the switch for its
intended purpose. I don't recall the particulars (it was a long time
ago) but it was probably just a matter of moving a few wires.

Well, someone recently won an item I posted for auction. They don't respond to email, haven't sent money and have about 30% negatives. In retrospect, 30% is not someone you want to deal with but how do you prevent them from winning the bid? In my post I said "bidders with negative feedback, go away". That didn't work... :(

You, as the seller, set the rules for your auction. If you state no
bidders with
negative feedback, and one bids, you simply cancel the bid and block that
bidder from your auctions. Most sellers do allow negative bidders to
contact
them before bidding to check things out to be fair.

Also, threatening negative feedback is against eBay rules, even if the
other
person deserves it. Be careful.

Try Sherwood at http://www.sherweng.com/index.html

They do a bunch of stuff for jrc515s, and might be able to help you.

In one section, they mention adapting Collins mechanical filters to 515s.

I think eBay's rules can be abusive. Several times I have threatened to give negative feedback if the other party did not perform, and that did the trick. So, that is against the rules? Well, fuck them. Let them reimburse me for my lost money in that case, otherwise they are abetting criminal behavior in my book.

To me the biggest turn-off was "I haven't fired up the unit, but..."

When they can't even tell you whether it works, and it's as complicated as an old Collins, and the buy-it-now is over $500, and there is no info whatsoever regarding who used to own it, it turns into a big crapshoot, and the guy wants you to pay the shipping service to come pick it up and pack it????

Where did it say that? The way I read it was he would drop
it off at a shipper and let them pack and ship at the buyers
expense. That is normal for a lot of auctions. Did anyone
get a shipping quote from the seller to see what it would be?

I agree on the price and heritage, however....

I've handled about 200 Ebay auctions over the last few years and have ran into 7 or so winners who simply wanted to complain no matter what. Once a guy won an auction and I tried contacting him for weeks without success. About a month later I got a Paypal payment from him out of nowhere. I told him through several bouts of logic that I had already resold the item, but he still threatened negative feedback. In another auction, a guy wanted to leave negative feedback since he felt I hadn't put enough packing in the package... yet he admitted the item arrived in excellent shape and he was thrilled to get it.

If someone threatens negative feedback and I know I'm not in the wrong, I will warn them up front that the feedback will be reciprocated with the same. This will usually stop most whiners cold. To this day I have had no negatives or even a neutral.

I once dropped the ball on one auction a year and a half ago.
I thought I took care of it, but apparently didn't. I was
traveling at the time. I otherwise have a good record on
about 125 deals..

I'm trying to buy something right now, and haven't heard from the seller, but I did it on "Buy It Now", and they might not even know it's sold, so while it's been three days, I'll let it slide for a while. And, of course, the holidays disrupt everyones lives.

Sometimes, you just have to give slack. OTOH, there are people who will complain no matter what.

Is it possible to find out what kind of feedback has been given by a given user? Chronic complainers could be allowed for then.

Michael,

There are a group of hams with an experimental license for the old MF CW band. Look in the archives for this group and they'll show up. One of them might want your TX.

I still have the Westinghouse 3KW MF transmitters from WNU if anyone wants to haul them away before they start getting rusty...

Exactly. And being sure to not threaten or give out negative feedback to
anyone else will also help to keep your record clean. You can't destroy
someone else's record with a negative and expect them not to return the favor.

This should be a lesson to all. If you plan to give out any negative feedback, be sure to expect negative feedback given to you as well. Is it worth getting your record destroyed for? An eye for an eye.

I would never purchase from anyone with ANY negative comments. Just as most sellers state in their auctions that they reserve the right not to sell to anyone with any negative comments.

If you purchase from someone with any negative comments, and you end up with any difficulties, don't come crying back here about it. You took the risk that was plainly marked trouble.

So, if you run into a terrible seller, you shouldn't leave negative
feedback, and you
think negative retaliatory feedback is deserved for doing so?? That is not
what the
feedback system is intended for. It's pretty easy to ferret out when
negative feedback
is deserved, or not. The way a person responds to feedback speaks volumes.
It's
also easy to pick up the feedback left by someone for everyone he dealt
with.

BTW, I've seen many instances on eBay where "honest" sellers with flawless
feedback
have turned bad, and pulled some very outrageous scams. Read the posts in
SafeHarbor
for some examples.

Pete

Pretty harsh. If someone has negatives but the ratio of negatives to positives is low (define your own standard), it wouldn't hurt to check for an explanation. In my case I have an overall rating of 59 and one retaliatory negative. Thank goodness ebay at least began allowing a response to negative feedback--mine was to encourage anyone who might have doubts about doing business with me to contact me for the full story. My ebay ID is W3AVE--check it out for yourself.

Well, you'll never buy from me, then, because I have one.
This guy wrote me negative feedback because I didn't respond
to his email within a few hours. Hours, mind you- not days.
I wrote him the day after the auction closed
and he had already nailed me.
You can't reasonably make a hard "no negatives" rule
because there are loonies and a-holes out there.
I know many honest and forthright sellers who
bend over backwards to deal "four square"
and they still have a negative or two.
Kindly,
Dave S.

Amen, Dave. OTOH, your 1 to 2 percent rule of thumb might eliminate me from any ebay deals with you, since 1 negative out of 59 is dangerously close to 2 percent....<g>

OTOHOH, thanks for our recent trade. The mike really looks nice. I hope your friend appreciated the WE tranny.

73, Avery W3AVE in Potomac, Md.

Agreed. 2% is the dividing line. I've learned through bad experience to read the feedback before bidding on expensive items.

Pay close attention to the _kinds_ of complaints. If the recipient of the bad feedback makes lame excuses, or sounds arrogant or supercilious, beware.

This happened to me a few years ago. A woman with a flawless record (over 250 positives, no neutrals or negatives) sold me a "like-new" camera with severe cosmetic damage, then refused to respond to either me or eBay management. I left negative feedback and got some of my money back through a fraud claim.

> Harold W4PQW

Not to be picky, but the bias should referenced from cathode to control grid and not just control grid to ground. If there is no resistor to ground in the cathode circuit, then reference to ground is warranted.

Whatever you do, please be careful as the voltages in a pa can kill or maime. Don't wear jewelery when testing and keep one hand away from the chassis (e.g. inside your back pocket).

Did anyone notice that RF is a royal pain?

Good luck.

Does this mean you get to lie about the other person if you get a bad
report after being a bad e-bayer? Anyone who lies about me in a case
like that is making a mistake they will regret later. MK

While you are certainly entitled to your opinion - your "absolute" judgment of a person based on a very flawed and easy to abuse system is quite unfair. There are people who deal with careful honesty, do everything possible to please a buyer - and still wind up with a negative feedback from someone bent on doing it "their way" regardless of stated auction terms - or ebay rules. The only reason I don't have a negative on my "perfect record" is because the individual broke so many ebay rules - ebay took the unusual step of removing the feedback. A "perfect record" is no guarantee; just as "a negative" (or some reasonable percentage of a high-volume trader's record) is not necessarily a condemnation - I agree with David - there are those that don't obey the rules; and that act childishly (or worse). Reading not only the feedback in question - but the response to it may shed much light - an email exchange with a potential trading partner may reveal much - and is prudent in any "high value" exchange - regardless of "feedback records". I bought a Hammond Organ on ebay several years ago - sight unseen; and more than a few dollars. After exchanging a couple of emails - and a couple of phone calls - I was confident of both the item and the seller... and made a great purchase. Communications (IMHO) is the key to good "ebaying"... feedback is but one tool.

Merry Christmas to all...

2% is not a bad number, depending on if you are buying or selling. Remember only about 1/3, from my experience, leave any feedback at all. So, in reality the 2% could, in reality, be less. I have easily made over 2000 transactions on ebay over the last 5 years and only have a little over 700 feedbacks. Out of those only a little over 500 are from unique individuals/transactions as that is what shows up in your total. And, most of you are right. I have two negatives, one of which was in retribution to mine. The other was my fault due to my stubbornness. The 3 neutrals were due to 2 members who are no longer members, so you automatically get your positive converted to a neutral, and the other, from a first time user that made a mistake, and this was back when they could send you multiple feedbacks, so after she realized her mistake she sent me a positive. The bottom line, if you are buying beware, if you are selling you have nothing to loose. Merry Christmas & a Healthy and Happy New year with all the radios you wanted. 73 - Mike

Richard Steinfeld wrote:

> Please explain re: "...getting your record destroyed..." Thanks.

One negative comment destroys your record. You will be UNABLE TO PURCHASE anything from the thousands of sellers who always put in their auctions that they will not sell to anyone who has ANY negative comments. Some quick examples I brought up by just searching for random auctions:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1053821536
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1498661493
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1053061728
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1681355827

AND, you will be unable to sell anything to the thousands of people that will never bid on an item from someone that has ANY negative comments.

Also.. Before bidding, one does a search on the seller's previous auctions to see if they ever left any negative comments to previous buyers. If so, one will not bid from that person. If any seller puts in their auction threats of negative comments: "I give negative comments for..." this is a clue to not bid from this person.

> think negative retaliatory feedback is deserved for doing so??

First of all, you would not BID from a terrible seller. If someone has 200 plus positive comments with no negative or neutral, then you are safe to bid. If you bid from someone with any negative comments, then why be upset when you get screwed by them? It is YOUR fault, as you had warning.

It is not a point of negative retaliatory feedback being DESERVED, it is just a FACT. If you want to risk getting the retaliatory feedback, you are free to do so. But if you want to keep a clean record, it makes sense not to leave any negative feedback because it is only going to get you the same, deserved or not.

> That is not
> what the
> feedback system is intended for.

Agreed, but that is what the feedback system is USED for. If you don't want to heed my warnings, go ahead and leave negative comments and see for yourself. Go ahead and be smarter than me.

> BTW, I've seen many instances on eBay where "honest" sellers with flawless
> feedback
> have turned bad,

I have yet to have any problem from someone with hundreds of positive only comments. I don't deal with anyone else, so perhaps some of your so-called "honest sellers" are ones with less than that type of record, and I have no experience with those types of sellers, nor will I ever.

If everything stated above were to be taken as true fact, then one would have to wonder what you considered "cosmetic damage", if the item was described as being "mint condition" , "new in box", or "never used" (which we tend to doubt) and how you presented yourself when asking (or demanding) for a refund.

However, to be fair, it is possible that this seller did screw over several people that chose NOT to leave any negative comments to her, in fear of getting retaliation negative comments. However, you could find this out by checking her past auctions and making sure that there are comments listed from each of those past buyers, if some buyers did not leave ANY comments, then this may be the case, else if everyone left comments, you most likely handled yourself wrong, or she never received any of your email, or dozens of other possibilities.

In any case, if you deal only with sellers with 250 plus positive only comments and get screwed, there is not much you can do, you did the best you could to determine the seller was safe to buy from. But if you buy from someone with negative comments, you have no right to complain when you get screwed, as it was your own decision to take that chance, knowing they screwed someone else in the past.

This is indeed what many people do. But when someone else in the future reads the negative comment that is only lies, they won't know that those are lies, will they?

Understand, I am not saying YOU OR I should give retaliation negative feedback, only that this is what people DO, and leaving someone a negative will most often result in you getting one back. Sure it could be one stating lies, so what? No one reading it will know it is a lie, only you. Do you want to take that chance?

> Anyone who lies about me in a case
> like that is making a mistake they will regret later.

Perhaps, but you will still be stuck with that negative comment in the end! Ebay will NEVER remove it. My friend got a negative comment to his account by someone who he never even DEALT with! (this was back when you could leave comments to anyone, now it can only be done if you went through a completed auction with someone) He emailed the person, and it turned out the person left it to him by mistake, as they had similar usernames. He left a positive comment under the negative explaining his error, even emailed Ebay to remove his negative left by mistake. Ebay to this day, refuses to remove that negative! Now if they refuse to remove one under these circumstances where the person who posted the negative wants it removed, imagine trying to get them to remove one in any other situation! It will NEVER happen, guaranteed!

The lesson to be learned here, is not that you DESERVE to get a negative to your record for leaving one, only that it will happen, and that you be forewarned of this. If you are ok with it, then go ahead and leave the negative comment.

If that is true, that is too bad, but sorry I don't know you or if your comments above are the truth. If I took just your words above as true, why not the negative comments from the other guy I don't know??

> You can't reasonably make a hard "no negatives" rule
> because there are loonies and a-holes out there.

I can and will stick to my no negatives rule. I don't know if the guy's negative is indeed correct, or your sad story above. The only thing I DO know for sure, is that if I don't bid from you (because of your negative comment) I will be safe no matter which one of you is telling the truth! So it is therefore more logical and intelligent for me to not bid from anyone with a negative comment. This is bad for people like you (assuming your are telling the truth) but safe for people like me. Sorry, but I am not going to put myself at risk because of some stranger on a newsgroup that I don't know anything about.

> I know many honest and forthright sellers who
> bend over backwards to deal "four square"
> and they still have a negative or two.

There can be no way to dispute that. Surely some great sellers get negative comments they never deserved. The point here is I will not take that risk, and no one can dispute it is the safe thing to do.

I can honestly say that I have never been screwed over by anyone with my "no negative" (in addition to 200 plus positive) rule, so I must be doing something right. Especially after reading so many horror stories on this newsgroup about people who are getting screwed!

Not surprising to me, after hearing a few say they will continue to bid on items from sellers with negative comments.

You seem to be overly worried about this "problem" of negative
feedback. My wife has 748 positives, 8 neutrals, and 3 NEGATIVES. It
doesn't appear to hurt her buying and selling.

The same thing is done with regular businesses. You call the Better Business Bureau, and if there are complaints, you shop there at your own risk.

> There are people who deal with careful honesty, do
> everything possible to please a buyer - and still wind up with a
> negative feedback from someone bent on doing it "their way" regardless
> of stated auction terms - or ebay rules.

Understood. But it is impossible for me to figure out if a negative was left for due cause, or a lie. The only way to be safe is to not deal with anyone with a negative comment. The sellers make the same rules for buyers and thousands refuse to sell to anyone with ANY negative comments, so why can't I do the same thing to cover my ass? I can, and chose to do so. If you want to jump out of airplanes with a parachute, fine, but you risk the chance of the chute not opening and you dying. I chose not to do this act at all, and will never die due to a parachute not opening. Telling me I am not fair for refusing to jump out of airplanes is ridiculous.

> The only reason I don't have a
> negative on my "perfect record" is because the individual broke so many
> ebay rules - ebay took the unusual step of removing the feedback.

That makes no sense. Someone left a negative to a friend of mine, begged Ebay to remove it as he left it to the wrong person by mistake, yet Ebay refuses to remove it to this day many years later. Sorry if I find it hard to believe that they ever removed a negative comment for you for any reason.

> A
> "perfect record" is no guarantee;

Of course not, especially if the person only has a few dozen positives. However, if someone for example has 2095 positives with no negatives or neutrals, then I would say that IS a guarantee for me.

> Merry Christmas to all...

Glad to see someone say that. In this politically correct world where every public posted sign has to say "season's greetings" or "happy holidays" including all Christmas cards received by companies, it is good to see someone like yourself not afraid of "offending" anyone, and just saying "Merry Christmas" as everyone used to do before the past few decades.

Out of 59 feedback messages, I got one negative from a "newbie" who didn't think to email me before posting it. I had sold two nearly identical automobile radios and mixed them up in shipment. I replied to the negative with an explanation, and the guy replied to my rely with a "sorry, I retract my negative...". Unfortunately, you can't retract it, but the record is there for all to see. And it hasn't hurt my buying and selling, either.

That doesn't surprise me, nor the fact that you find that something to brag about.

That's your witty debate to my statements? Another cheap copout from someone who realized he had no way to dispute my statements, and instead of admitting it, took the easier route of just yelling troll to get the last word and run away and hide.

Does this mean that everyone that takes the safe route and does not buy from sellers with negative comments are trolls too? I never said everyone else had to do what I do, did I? Hmmm, so then it could also be taken that in order to not be a troll, one would purchase from sellers with negative comments.

So, I can be a troll who keeps her record of never being screwed from anyone on Ebay, or I can be someone honorable like yourself and risk the chance of one of those negative comments actually have been deserved and getting screwed by a seller. I will have to remain a troll then, and take pride in what your definition makes me to be.

Glad to hear it! Now what about all the other poor slobs in which the person leaving the negative WANTS the negative there and does not want to retract it, even if it is not deserved? That will hurt someone's buying and selling, and that is 99% of how it is, your 1% rare case is not going to make all those other people's buying and selling any easier.

The TS-830M was produced concurrently with the TS-830S. The " M " model was not sold in the USA but was marketed in EU and Asia.

I have a TS-830S and I converted the CW narrow position on the bandswitch to run AM.
I was just curious what the manual for the TS-830M had to say about recommended
settings for carrier and audio.

I have documented the changes if you want to make the conversion. It requires building
a small AM detector circuit and altering the bandswitch wiring.

Yup, I came to that same conclusion (troll or fool) - and have also done
the same (dropped "sender" into the "ignore" filter file). Gee - two
people in my "ignore filter" at the same time - that's a record!

Is this guy trolling? I certainly don't have any trouble
selling anything, and it's never prevented me from
buying anything.

As for someone who foolishly writes in their listing
that they won't deal with someone with even one negative,
I don't want to become involved with someone who is
either severely childish or mentally unbalanced.

It is neither something to "brag" about nor not to "brag" about.
Negatives and neutrals can be over next to nothing or can be quite
serious. Some buyers and sellers can be very intense and expect more
than they deserve. Basically, each transaction stands on its own,
as-far-as I'm concerned.

5432. Re: TS-830M info

The TS-830M was the same as the TS-830S except for the modes available.

I run mine at 90 watts input on AM. The pair of 6146 finals are rated to handle
that without any problem.

I am currently changing the metering circuit to provide indication of the modulation
level using the HV position on the meter switch.

That is not something that is on the 830M though. It just makes adjustment of
the audio level easier when running AM mode.

Well I just pulled this up and am responding to it due to a "heads-up"
from a friend via email about it... seems Mr. J. Claus decided to
suggest that I'm a liar; and since I had already placed him in my
"troll" list (ignore filter file)... I had indeed missed it. Well
let's just see...

I originally wrote:

> > The only reason I don't have a
> > negative on my "perfect record" is because the individual broke so many
> > ebay rules - ebay took the unusual step of removing the feedback.

then Mr.Jasper Claus wrote:

> That makes no sense. Someone left a negative to a friend of mine, begged
> Ebay to remove it as he left it to the wrong person by mistake, yet Ebay
> refuses to remove it to this day many years later. Sorry if I find it hard
> to believe that they ever removed a negative comment for you for any reason.

So, you find it hard to believe. Afterall - I'm such an un-known and my
words have no weight.
So, Mr. Claus what about you? - are you all mouth, or are you ready to
backup your blathering with something more substantial - say a wager of
$10,000 US Dollars?

This is a public forum. I'm willing to make the wager here and now, on
the record:

I recently had a negative posted by a buyer to my ebay record. The buyer
violated ebay rules / policies. I sent the details to SafeHarbor
Investigations - they (ebay) removed the negative feedback. $10,000US$
says this is true - care to bet?

Put up - or shut up.

(oh, and yeah - I've pulled you out of my "ignore filter" file long
enough for you to get your foot out of your mouth).

Some "Merry Christmas"... (not to mention today is also my birthday...
the above "note" was such a "nice present" --- bah humbug!).

(just the same - Merry Christmas to all...)

HA! Yeah right. It is amazing that everyone that claims they put people in their "kill file" always manage to continue replying to the same very people they claim to have kill filed! This type just can't resist getting in the last word and are the types who would NEVER use a kill filter.

...get ya down.

The mentally deranged ravings
of someone like this jASSper claus wacko
cannot diminish the good hearted, generous spirit
of the majority of people on this group.

He's good for comic relief, anyhow.
I'm sorry, but the snarled, stained traffic map
these people use for a "logical reasoning process"
is just,.... well.... Funny! The ID he's using this time
to putt-putt around Loonyville is fast running out of gas.
Wonder what the next one will be?
The crazy are endlessly entertaining.

Dave S.

I'd adjust with about the same ratio as most all the other rigs that
include AM. I'd only run about 40% of full cw power on AM. So if the
rig did 100w, I'd only do about 40 watts AM carrier. The audio
"should" want to be in same place as when running SSB. You shouldn't
really have to change that I wouldn't think. IE: If you run the mike
drive at 12 oclock with ssb, AM should be about the same for a decent
audio level. If you run much more than 40 watts, you could overheat
the power supply I would think. MK

The vendors of all the items you have listed have at least one negative
feedback. They will never get any bids because who would want to purchase
from a person who (gasp) has negative feedback. They might be crooks. They
might cheat on their income tax ! They might not obey the speed limit while
driving !

GET A LIFE !!!

They will if you rebutt them. I'd make the lying sack of caca prove
it.
>
> Understand, I am not saying YOU OR I should give retaliation negative feedback, only that
> this is what people DO, and leaving someone a negative will most often result in you
> getting one back. Sure it could be one stating lies, so what? No one reading it will
> know it is a lie, only you.

Well, if I rebutt the single bad report, and the rest of my entries
are clean, well....I think they will get the drift...

Do you want to take that chance?

Sure. If someone lies about me, and won't retract it, I'll just hunt
them down and kick their ass. End of that problem. Corn on the cob is
no fun with no teeth. I'll make them pay for being a liar. Sure, I may
go to jail for assault, but I'll have my e-bay "lie" retraction before
I leave.
I don't play little winky ass radio games. They lie about me, about
something as serious as that, they better grow eyeballs in the back of
their head. I won't put up with it. I'll hop a southwest jet and go to
hunting. I have plenty of time to kill. Do THEY want to take that
chance??? MK

Dear radio amateurs,

I would really appreciate it if you could help me with the following:
The reception of telephony in SSB mode (both LSB and USB) of my
Skanti R5001 is impossible due to the fact that voices sound totally
distorted. It does not matter whether I use the A3J-A3A mode setting
or the A1 setting, using the Clarifier/BFO.
I do own the instruction manual, and I have allready measured some
voltages in the power-pack P5013S (220 Volts).
Is there anybody able to give me a few good hints as to overcome this
problem.
Reactions are really appreciated. Thanks in advance.

R. Koopmans (nl12814@amsat.org)

The TS-830S is rated 180 watts with the pair of 6146 finals. The
thermocouple readings show a normal temperature rise when running just under
100 watt carrier on AM.

I have had no problem running AM on the rig, I was just curious what the
owners manual
for the TS-830M had to say about tuning it up in that mode.

Thanks and 73,

Beste Koopmans,

Ik heb het zelfde gehad, echter soms lange tijd niet.
Mogelijk heeft het iets met temperatuur te maken, na enige tijd treedt het
pas op.
Ik kreeg het pas na jaren.
Ik heb het nooit gerepareerd, maar weg gedaan.

From: ehsjr@bellatlantic.net
Message-ID: <3C2A03D8.94FEBF24@bellatlantic.net>
Source record: 46357

Post some details. Often, meter replacement is
a matter of finding the same size (physical) meter,
removing the scale from the defective meter and
installing it in the new one. If you get the same
electrical size (full scale rating), you're done.
That's the simplest route, other than having the
exact replacement part.

Next in complexity, if you get the same physical size
but different electrical size, you need to change the meter
shunt or circuit to the meter to accommodate a different full
scale rating. For example, replacing a 500 ua meter with a
100 ua meter requires shunting, so that the meter movement
"sees" 1/5 of the current the old meter movement "saw".

Highest in complexity is replacing with different physical
and electrical size while retaining the original look.
I just completed rebuilding a meter - I had to remove the
movement from the housing, and install a different movement
in the old housing. There was a lot of drilling, filling, sanding
and shimming involved - but I finally ended up with a good
working and perfect appearing meter. Not a project to be
approached with speed in mind - those movements are delicate.
But it is something you can do with ordinary skill and hand
tools.

So, what is the physical size of the meter, and what is its
full scale rating? Who manufactured the movement?
You may find a surplus meter from say an x-ray machine,
calibrated in roentgens and made by Simpson, that is
the same physical size as your meter. If it also is the
same electrical size and manufacturer, you just remove
the scale from the VTVM meter and put it in the
one from the x-ray machine. If it is a different manufacturer,
the scale may not be easily swappable to the x-ray meter.
You remove both scales, and make a Xerox copy of the vtvm
scale. Glue the copy to the backside of the x-ray scale,
and install it "backwards" so you can see the copy.

This cat can be skinned - but it make take some ingenuity.

Message-ID: <20011226174407.28038.00000946@mb-cq.aol.com>
Source record: 46373

I recently bought a Yaesu FRG-7 and when I tune in a station and change the band switch the station is still on the other bands, am I doing something wrong or is the radio in need of repair? I do not have an instruction book with it. Here are the steps I do to tune in a station. 1. Set Band Switch, 2. Set Preselect, 3.Set MHz until lock light is off, 4. Tune the drum dial that is marked 1 - 1000 until I tune in a station. Once the station is tuned in and I move band switch to any of the bands that station is still there. Thanks for any help on this problem.

I had to 100% replace all the caps in my 120X, too. My low sens problem was traced to a weak LO. That taken care of, its as hot as any of my BA's now.

Hallicrafters SX-101A 80-10M ham band communications receiver in prestine condition. This radio has been completely gone through with all capacitors, resistors, tubes checked and replaced where needed to restore performance back to original specs. Front panal is flawless (original) as is the cabnet (refurbished). Completely aligned and working perfect. I also have the matching R-46B speaker, which is in excellent original condition. I really perfer a local pickup in the Portland, Oregon area as it would be heavy and expensive to ship... $450.00

Pat, AA7FG - Oregon

Have for sale the following Signal/One Accessories & Parts:

Very rare 1200 Hz filter for the CX7/A/B and CX11A (ever see one?) for $150.00.

CX7 parts radio, it is all there, it lights up but doesn't work, but has a good power transformer for $275.00

CX7 enclosure, professional correct epoxy paint repaint, looks like new for $95.00

8072 tubes, good pulls $35.00 each or $75.00 for three

CX7/A nixie readout board, test good, $125.00

CX7/A/B PTO (vfo) assembly, tests ok, $45.00

CX7/A/B power transformer, tests good, $125.00

CX7/A/B complete knob set, pulls, look ok, $85.00

All above plus ups ground shipping.

5490. FS: ETEK FR-4 Digital Readout for Drake 4-Line

In case you missed it, he said that he took you off of his kill list to
see how you would respond to his challenge.
Which you've so far, managed to completely sidestep.

The problem with you're arguments appear to be your unwillingness to
allow anyone an opinion different
from your own.

Jeff

5492. WTB: Dow Key (or similar) T/R relay

In article <20011226174407.28038.00000946@mb-cq.aol.com>, radiotube@aol.com (RADIO TUBE) writes:

>Here are the steps I do to tune in a station. 1. Set Band Switch, 2. Set >Preselect, 3.Set MHz until lock light is off, 4. Tune the drum dial that is >marked 1 - 1000 until I tune in a station. Once the station is tuned in and I >move band switch to any of the bands that station is still there.

These "Wadley Loop" sets work very well, but they are very poor at rejecting other signals of the same KHz but different MHz, which sounds like what is happening with yours. Therefore, you need to carefully retune and peak the preselector dial (and change its bandswitch as needed). The preselector prevents signals on related frequencies from reaching the rest of the radio, and boosts the signal you want.

Properly tuned, Wadley Loop sets are superb performers, just a little tricky till you get used to the tuning.

In fact, you *may* be saying that what you change is the "band switch", meaning the Preselector band switch. Changing that will definitely weaken the station, but not necessarily kill it.

Anyway, it's important to realize that the 4-position "band switch" controls only the preselector, the tall drum tuning dial. The rest of the radio has no band switch -- that's the beauty of the Wadley system. Instead, the MHz dial serves as the band switch for that section.

Given any radio with a preselector section, you need to tune the preselector and the rest of the radio together. Once you have both sections tuned to the same frequency, you should *not* get interference from stations on far different frequencies, unless something is wrong with the set.

Once you've tuned a station with the 0-1000 kHz dial, go back and peak the preselector tuning. Also slightly fine-tune the MHz knob for best reception.

The FRG-7 is a fine radio. You'll love it. Good luck, Mike K.

Oscar loves trash, but hates Spam! Delete him to reply to me.

The bandselect switch on that radio is only for the preselector....Your actual tuned band is the 1 Mhz segments (you ought to notice that your signal is affected in strength only, by the position of that "band" switch).

CC-AWA's Annual Conference,
The 26th, Anniversary "Spring Meet in the Carolinas".
An annual conference for radio collectors & historians.

March, 21-22-23, 2002, Thursday, Friday & Saturday.

At the Sheraton Charlotte Airport Hotel, Charlotte, NC.

For full details please visit our web page at,
http://www.cc-awa.org

There you will find a schedule of all events, and a
"printable" pre-registration form.

Soon to be added will be a listing of Old Equipment Contest
categories.

There are also links to pages with information about
the "Special" Military Equipment Auction and "Radio Rescue".

Full conference brochures will be mailed in January to all
CC-AWA members, all AWA members living in North & South Carolina
and anyone that has attended the conference in the last 4 years.

If you have any question, please let us know.

Ron Lawrence KC4YOY
CC-AWA President & Conference Chairman

POBox 3015

Source record: 46303

Hi Mario,

Nothing is wrong with your receiver. You can expect that to occur with the FRG-7, especially if you have a good antenna and strong signals. The bandswitch, the preselector, "set" MHz, and tuning control all work together.

Your tuning sequence is fine -- the only thing I would change in your procedure is once the signal is tuned in, tune the preselector slightly, one way or the other, to peak the signal.

Below is a nice FRG-7 specific site. Manuals, schematics, general information.

http://www.crocuta.com/FRG7/index.html

Enjoy your GREAT receiver.

hello,

i have:

1 Swan 500 (not c) amateur transceiver 80-10 meter operation. low output
on 15 meters. cosmetics is 8.5 to 9 of 10.
1 410 external vfo
1 22b vfo adapter
1 vx-2 vox unit
1 117xc power supply/speaker
1 fs-2 field strength meter
1 wm-3000 2000 watt meter
1 sure 444 desk mike with swan logo

i want:

a clean, fully functional heathkit sb-220 amplifier. no junk.

if someone wants to buy the package outright, email me and we can talk. i
will NOT split the package until the radio/power supply has been sold. if
someone wants the rig/powersupply, all other options will be listed
seperate. equipment will be sold/traded as is. this station is in service
in my station at this time and is operational. if a deal is struck, we will
discuss shipping.

thanks

Hi all!
This is the black vernier dial, made by National about 2 1/2" in diameter with a 0-100 scale that sticks out from the knob by about 3/8" The ratio is about 5 to 1. It originally was from a TU6B WW2 surplus Tuning unit (also in TU7B, TU8B and TU10B units) I think from the BC610?)

I have one and need a second one for an antenna coupler I am building. Can anybody help?

Source record: 46313

Hi all:
I just bought an old HW-100 and would like to get it up and running...
There were two QSTs that refer to a PTT relay hangup (I have this) but the
years are not listed.
In any event, when the radio is turned on, about 80% of the time the PTT
relay lock up and the radio goes into transmit.
Does anyone know what the past QST's referred to, reference a mod to stop
this.
I would normally assume the tube is conducting, but the references to the
QST seem to indicate there is a mod to cure this.

> anybody help?

As it is not for a restoration (i.e., exact part required), you may
find the RatShack verniers to be excellent for your purpose - they
have been used in many antenna tuners & are good.

AMATEUR RADIO NEWSLINE(tm) REPORT #1272 - DECEMBER 28 2001

==========

A NOTE TO THOSE WHO ONLY “READ” AMATEUR RADIO NEWSLINE(tm)

For those of you who only know of the Amateur Radio Newsline (tm) as a text newsletter we would like to invite you to listen to the audio version. This Amateur Radio Newsline (tm) script is actually written for the “spoken word.” It is recorded each by professional broadcasters and is available for private listening or rebroadcast over your repeater. Three methods of delivery are available: Streaming audio using RealAudio, FTP RealAudio or dial-in telephone. Please visit our website at http://www.arnewsline.org for a list of telephone numbers (you have to pay your own long distance charges) and links to audio servers providing our voice newscast (for free).

de
The Newsline Production Team

==========

Amateur Radio Newsline report number 1272 with a release date of Friday, December 28th, 2001 to follow in 5-4-3-2-1.

The following is a Q-S-T.

A not so welcome FCC Christmas present for several hams and an ARRL survey says that most hams no longer want the novice bands. These stories are first on this New Years week edition of the Amateur Radio Newsline coming your way right now.

(Billboard Cart Here)

**

ENFORCEMENT: FCC DESIGNATES KEVIN MITNICK, N6NHG, LICENSE RENEWAL APPLICATION TO PUBLIC HEARING

A convicted computer hacker now has to face an FCC if he wants to keep his ham radio license. This, as the regulatory agency designates the Amateur Radio license renewal application of Kevin David Mitnick, N6NHG, for hearing. We have this report:

--

According to the FCC, Kevin David Mitnick is best known to the world as a hacker who admitted that he broke into a number of computer systems and stole proprietary software belonging to Motorola, Novell, Fujitsu, Sun Microsystems and other companies. He has also admitted using a number of means to commit

his crimes including social engineering, cloned cellular phones ad sniffer programs placed on a victims computer system. Mitnick even acknowledged altering the programming of computer systems belonging to the University of Southern California and using these computers to store programs that he had misappropriated.

Mitnick was sentenced to forty six months in federal prison for his August 9th 1999 conviction. He had previously been sentenced to twenty-two months in prison for possessing cloned cellular phones after his arrest in North Carolina in 1995 and for violating his supervised release that had been imposed after his conviction for unrelated computer fraud in 1989. He is currently on probation following his release from prison in January of 2001. And in December of 1999, Kevin David Mitnick, N6NHG, applied for renewal of his Amateur Radio Station and his General Class Operators License.

His license expired on December 12th 1999. The FCC put the renewal application on hold pending further inquiry. Now the agency has made public that it intends to challenge Mitnick's right to hold a ham radio license and has issued a Hearing Designation Order. In plain English, that means Kevin David Mitnick has to prove to the government why it should renew his ham ticket or have his license cancelled.

The FCC is challenging Mitnick's license renewal request on the ground that his past criminal behavior raises a substantial and material question as to whether Mitnick possesses what the it terms as the requisite character qualifications to remain a Commission licensee. The FCC says that in the context of broadcasting licenses, it has long held that evidence of any conviction for misconduct constituting a felony will be considered as relevant to its evaluation of an applicant's character. It also says that the broadcast character qualifications standards have been used as guidelines in the evaluation of non broadcast licenses including those in the Amateur Service and that the courts have upheld the Commission's right to do this.

The agency cites two recent cases. That of Herbert L. Schoenbohm, the ex-KV4FZ and Leslie Brewer who used to be KC4HAZ. Brewer, also known as the Tampa Party Pirate lost his ticket because of his unlicensed broadcasting in the commercial F-M band . Schoenbohm lost his based on a fraud conviction of using an unauthorized telephone access device. And the FCC says that any conviction for fraudulent conduct calls in question a licensee's ability to act in a manner consistent with FCC regulations.

And so the FCC has ordered that a hearing be held before an Administrative Law Judge to determine the effect of the criminal convictions of Kevin David Mitnick on his qualifications to be a Commission licensee. It also says that pursuant to provisions of the Communications Act, the burden will be on Kevin David Mitnick, N6NHG, to provide proof that his license renewal application should be granted. Mitnick was given 20 days of the mailing of the Hearing Designation Order to file a response.

For the Amateur Radio Newsline. I'm Andy Jarema, N6TCQ.

--

The hearing designation order on Mitnick’s license was adopted by the Commission on December 11th but not released until Friday, December 21st. Ironically, less than twenty-four hours earlier, Mitnick had made a guest appearance on Art Bell’s Coast to Coast A-M where he discussed his future plans. At that time he was apparently unaware that the FCC had some plans of its own in regard to whether or not N6NHG will remain a radio amateur and Commission licensee.

The complete text of the Mitnick FCC Hearing Designation Order is on the web at: http://www.fcc.gov/Daily_Releases/Daily_Business/2001/db1221/fcc01359.txt (FCC)

**

ENFORCEMENT: GERRITSON LICENSE PLACED ON HOLD PENDING POSSIBLE HEARING

Kevin Mitnick, N6NHG, is not the only person hearing from the FCC in recent days. So have a number of others including another Southern California resident who could face the same kind of a hearing. Riley Hollingsworth, K4ZDH, is the FCC’s Special Counsel for Amateur Radio Enforcement:

--
Hollingsworth: “We notified a Bell California licensee; Jack Gerritson, ex-KG6IRO, that the Wireless Telecommunications Bureau, had set aside his Technician grant so that a recent conviction for radio interference could be evaluated. Now, he has no authority to operate Amateur Radio equipment until the matter is resolved.”
--

The action to place Gerritson's license up for hearing was taken November 14, 2001 and is based in part upon complaints about the operation of his station and questions regarding Gerritson's qualifications to be a Commission licensee. The FCC says that both issues were raised as the result of Gerritson's 1999 arrest and year 2000 conviction for interference to police radio communications. (FCC)

**

ENFORCEMENT: FCC REOPENS KY-W.VA REPEATER CASE

The FCC is also continuing its crackdown in the area of repeater interference issues. In fact it is taking a second look at a coordinated versus uncoordinated issue in the Tennessee and West Virginia border area. Again, Riley Hollingsworth, K4ZDH:

--
Hollingsworth: “We notified parties in a repeater dispute in West Virginia that we would be reopening that case after information that one of the repeaters is coordinated after all. We had declined to intervene earlier this year in that case.”
--

The letter stating that the FCC is reopening that case went to Michael Horn, KB8GDF, of Lenore West Virginia, Kenneth Brown KF8HL of Davin West Virginia and Carl Tussey, KB4UCE of South Williamson Kentucky. Back on January 24, 2001,

had notified the three that it had received a complaint that they were operating an uncoordinated repeater on 145.390 MHz in Mingo County, West Virginia, and that this repeater was causing interference to the coordinated KC8FKP repeater operated by the Portsmouth Radio Club that uses the same frequency. The matter was closed when the FCC interpreted a notation in the South-Eastern Repeater Associations Repeater Journal that the status of the KC8FKP repeater was not known and interpreted this as meaning that the repeater was also was not coordinated.

But now the FCC says that it has recently come to it's attention that although in the SERA Repeater Journal says that the KC8FKP repeater may be listed as unknown, it is still a coordinated system. Therefore, the FCC is re-opening its review of the issues in this matter. (FCC)

**

ENFORCEMENT: IS A GOVERNMENT AGENCY RUNNING A HAM REPEATER?

Is a government agency operating ham radio repeaters in violation of Part 97 rules? Specifically, the FCC wants to know who is really running the KD6LSO and W6SON repeaters in Sonoma County California.

The FCC says that it has received allegations that the county is in charge not the hams whose call signs appear on the machines. Since a county governmental entity cannot be an Amateur licensee, the FCC is collecting information in order to determine if there are breach of its rules. (FCC)

**

BREAK 1

This is ham radio news coming to you from the United States of America. We are the Amateur Radio Newsline, heard on bulletin stations around the world, including Rocky Mountain Radio League repeaters serving Denver and Bloomfield Colorado.

(5 Sec Pause Here)

**

RESTRUCTURING: ARRL STUDY SAYS NOVICE BANDS MAY NOT BE NEEDED

An ARRL study group has recommended doing away with the current novice bands and divvying them up among the remaining licenses classes. Amateur Radio Newsline's Norm Seeley, KI7UP, has the details:

--

An ARRL Novice Spectrum Study Committee has recommended that the League petition the FCC to eliminate the CW novice subbands. It also wants a rules change that will allow Novice and Technician licensees with element 1 credit to be permitted to operate Morse code on the General 80, 40, 15 and 10 meter C-W allocations at up to 200 watts power out.

These are just two of the suggestions contained in a report that will be presented to the Leagues Board of Directors when that group convenes in mid January. The study committee will also suggest recognizing portions of the 80, 40, 15 and 10 meter Morse bands for what it calls ''slow CW operation.'' The committee says that this would aid new operators in enhancing their Morse code skills.

Finally, the panel also recommends re-farming -- that’s another way of saying reapportioning -- reapportioning the current Novice and Tech Plus subbands in part. This, to allow expansion of the phone allocations on 80, 40 and 15 meters.

What will the ARRL Board of Directors do? We should know in less then a month.

For the Amateur Radio Newsline, I’m Norm Seeley, KI7UP

--

The committee's determinations were based on opinions expressed by 4744 hams who respond to an ARRL Novice Spectrum Study survey launched last June. Those expressing their opinions included ARRL members and also non-members. What’s really interesting is that nearly 61% of those responding were Extra class licensees. (ARRL bulletin)

**

FCC INSPECTOR GENERAL'S REPORT: THE NAMES THE SAME

The latest report of the FCC's Office of the Inspector General contained very few items of intrigue. But according to the C-G-C Communicator, one of the more colorful incidents involved a person who allegedly used the name of an FCC employee to obtain the government-rate for a hotel room in conjunction with a government-sponsored event.

Well, it turns out that the subject was legitimately attending the event, was entitled to the government room rate and just happened to have the same name as the FCC employee. The bottom line: Case dismissed.

The complete report is on the FCC website at http://www.fcc.gov/oig/Semiannual093001-1101.pdf (CGC Communicator)

**

AMERICA AT WAR: NYC PHONE SERVICE STILL SPOTTY

It's been almost four months since the attack on the World Trade Center, and telephone service near ground zero in lower Manhattan is anything but normal.

According to news reports, repair people have restored service to most customers, but thousands of lines still aren't working. As a result, customers complain that some business lines can call out, but customers can't call in.

The collapse of Seven World Trade Center crushed thousands of underground cables at Verizon's nearby switching station. About 200-thousand telephone lines and three-point-five million data circuits were affected. The company says it'll spend as much as one-point-nine billion dollars to repair the

damage. (Telecommunications Online)

**

INTERNET SECURITY: PROBLEMS WITH XP

If you just bought a new computer equipped with the Microsoft X-P operating system, or have upgraded your old one, listen up. The Federal Bureau of Investigation says that you should take certain steps to protect yourself against hackers who might try to take advantage of major flaws that have been found in X-P.

The bureau's National Infrastructure Protection Center says that in addition to installing a free software fix offered by Microsoft on the company's Web site, consumers and corporations using Windows XP should disable the product's universal plug and play features as well. The FBI also warned computer system administrators to actively monitor for specific types of Internet traffic that might indicate an attack was under way.

The FBI did not provide detailed instructions how to disable plug and play. Outside experts also caution that disabling the affected Windows XP features threatens to render unusable an entire category of high-tech devices about to go on the market. This includes a new class of computer printers that are easier to set up. But the same experts also acknowledge that disabling plug and play in X-P could afford some protection against similar flaws discovered in the future.

Microsoft considers disabling plug and play options as being unnecessary but the company does acknowledge that Windows X-P suffers from serious problems that can let hackers steal or destroy data files across the Internet or implant their own unwanted software. The FBI says that the glitches were unusually serious because they allow hackers to seize control of all Windows X-P operating system software without requiring a computer user to do anything except connect to the Internet. (Published news reports)

**

THE LAW: A FIGHT AGAINST GRAY MARKET ELECTRONICS

A group of American high-tech companies is opening the year 2002 with a campaign to protect consumers from unwittingly buying consumer electronic products intended for foreign markets. Electronics that the manufacturers claim may not work in the United States.

Compaq Computer is one of the companies involved in the campaign. It says that the group will warn consumers about the dangers of buying such products, and how to avoid getting duped. The other companies in the group are Hewlett-Packard, 3 Com, Nortel Networks, and Xerox. The effort may prompt more lawsuits against distributors who resell so called gray market items in the United States. (Computer Products Daily)

**

SPECIAL EVENTS: USS ARIZONA K7A A SUCCESS

Steve Gurley, KJ7WK the coordinator of the USS Arizona Special Events Station K7A tells the Amateur Radio Newsline that the event was an overwhelming success. Gurley says that the memorial station contacted amateurs in all 50 states, and 8 other countries while handling over 2600 QSO's. In fact says KJ7WK, the sponsoring group has already received certificate requests from 609 stations as we go to air. There were ten operators in three counties in the Phoenix Arizona metroplex operational during most of the three days K7A was on the air. (KJ7WK)

**

SCHOLARSHIPS: DARA SCHOLARSHIPS FOR 2002

The Dayton Amateur Radio Association says that the nominating period for its annual scholarship program is now open. The deadline to receive applications is June 1, 2002 and the announcement of winners will occur around June 15, 2002. Applications are available from the DARA Scholarship Committee, 9873 Lower Valley Pike, Medway, Ohio 45341. Please note that this is a new address from years past. Again it is the DARA Scholarship Committee, 9873 Lower Valley Pike, Medway, Ohio 45341. Also, for more information on the Dayton Amateur Radio Association and its programs, please visit www.dara-w8bi.com on the world wide web. (DARA)

**

AWARDS: DARA OPENS NOMINATIONS FOR HAM OF THE YEAR

The Dayton Amateur Radio Association also asks that we remind you that the nominating period for the 2002 Dayton Hamvention Awards is now open. There are three awards presented each year. They are the Radio Amateur of the Year, Special Achievement, and Technical Excellence.

All amateurs Novice through Extra are eligible. Awards are decided by the Awards Committee, based partially upon the information received. Magazine articles, newsletters, newspaper clippings, videos and the like are appreciated but cannot be returned. The deadline for nominations is January 31, 2002. Nominations should be sent to Post Office Box 964, Dayton Ohio 45401. They can also be submitted by completing the e-form on the web at www.hamvention.org. (DARA)

CHANGING OF THE GUARD: BADGER STATE SMOKE SIGNALS EDITOR JIM ROMALFANGER, K9ZZ - SK

I’m Bill Pasternak, WA6ITF.

The ham who put the state of Wisconsin on the ham radio map has passed away. This, with word that Jim Romelfanger, K9ZZ died Saturday evening December 22nd of an apparent heart attack..

According to Romalfanger's close friend Ken Ebneter, K9EN, Jim has been in declining health for some time. Romalfanger had a stroke a few weeks ago, affecting his right arm which was already weakened by polio. But Ebneter says that K9ZZ seemed to be improving until just recently. Ebneter says that Romalfanger had been in the hospital early last week but was home when he passed away of an apparent heart attack. In fact, K9ZZ had stopped by to visit a ham radio friend that afternoon. Another friend found him dead that evening when he stopped by to visit.

His full name was Arthur James Louis Romelfanger but to the world of ham radio he was Jim, K9ZZ. And Jim Romalfanger made Wisconsin a ham radio household word by editing as three decade state-wide ham radio monthly newspaper called Badger State Smoke Signals -- and doing so as a volunteer.

Notice we said newspaper and not newsletter. This is because Smoke Signals is just that. A newspaper that at its peak ran up to 40 pages filled with articles about ham radio in the Badger State. In addition to being the 32 year editor of Smoke Signals, Romalfanger was nationally published over the years in CQ, QST, 73, Ham Radio, Popular Electronics, and other magazines.

Jim Romalfanger was first licensed January 1958 in Pacific Beach, California, as KN6LWB. Upgraded to General in May of 1958. He returned to Wisconsin that summer and became K9PKQ. In 1977, changed call to K9ZZ and held that call sign the rest of his life. Funeral services were scheduled for Friday, December 27th at St. Joseph Catholic Church in Baraboo Wisconsin.

Jim, from all of your friends at the Amateur Radio Newsline: We are going to miss you. (The Baraboo News Republic, K9EN, WB9QZB, and other friends of K9ZZ contributed to this report.)

AMAZING DISCOVERIES: CIRCLES WITHIN A CIRCLE

One of the most curious pure mathematical discoveries for 2001 was announced in the easy-to-read article at an incredibly long website. In brief the article says that research has led to some remarkable geometric findings involving interrelationships between tangent circles and spheres. In other words, mysterious circles within a circle.

As one researcher put it, "Where do these numbers come from? What's going on here?" Find out by going to www.sciencenews.org/20010421/bob18.asp (CGC Communicator)

**

INTERENATIONAL - CANADA: NEW ALBERTA SM

On the international front, word that Thomas Martens, VE6TRM, has been appointed the new Radio Amateurs of Canada Section Manager for the province of Alberta and the North West Territories. Martens replaces Alan Faint VE6QQ will

be stepping down from the position due to personal reasons. Martens will serve the remainder of Faint’s term which runs through June 30th, 2003. (RAC)

**

INTERNATIONAL-AUSTRALIA: CSIRO MICROTURBINES

Australian hospitals, restaurants and schools could soon source clean, reliable energy from mini power generators that operate independent of the main grid. This as CSIRO has installed Australia's first commercial microturbine, at their North Ryde Laboratory, Sydney.

The size of a small refrigerator, the turbine produces 30 kilowatts of power, independent of the electricity grid. And it does this with reduced greenhouse and other gas emissions. Thirty kilowatts is enough to power a medium commercial building such as a restaurant.

Along with fuel cells, gas engines, storage technologies and some renewable technologies, microturbines can be used to generate power close to the end-user and provide major gains in reliability and power quality. Once the design can trickle down to the home user level and price range, it could offer hams a way of always having emergency power always at hand. (Q-News)

**

SHORTWAVE MONITORING : RADIO NORWAY CLOSES

The Board of Directors of the Norwegian Broadcasting Corporation has decided to stop its own programs by Radio Norway International. This is effective as of December 31st of 2001.

According to DF5SX and G3VGW, Radio Norway’s final show was hosted by veteran broadcaster Einar Lie on New Years Eve. Also, the 1200 kilowatt Medium Wave transmitter on 1314 kHz on Kvitsoy was supposed to cease operation by December the 31st as well.

The Norwegian Broadcasting Corporation will have to negotiate with transmitter providers Norkring and Radio Denmark to close down as well. The Norwegian Broadcasting Corporation and Norkring have a contract for running the transmissions that goes through December 31st, 2003. The agency also has a leasing agreement with Radio Denmark for the same period. (Media Network)

**

DX

In D-X, keep an ear open for King George Island in the South Shetland group. HFZ0POL is reported on all H-F bands, including the newer ones, using CW, SSB, RTTY and PSK31. QSL HF0POL via SQ5TA.

And the United Arab Emerates has been heard lately A61AJ. He has been QRV on 40 meters CW around 1400 UTC. Q-S-L A61AJ via N4QB. (Various DX sources)

**

THAT FINAL ITEM: RILEY SAYS THANKS

And finally as the year 2001 comes to an end, the FCC’s Chief Rules enforcer, Riley Hollingsworth has some words of praise for the ham radio community. He passed them along through his bi-weekly Enforcement Log at www.rainreport.com, and thanks to them, we have is words for you:

--
Hollingsworth: “I would like to point out Hap, that this is the end of the third year of Amateur Radio enforcement and I will honestly say that the overall level of compliance in the Amateur Radio Service is outstanding. The Amateur licensees do a great job and they do a great job of showing that the Amateur Radio Service is -- indeed -- the only fail-safe communications system in the world and we are very proud of them.”
--

And if I can take off my reporters hat for a moment and editorialize a bit, I guess I speak for many who truly appreciate what you have done to return the Amateur Radio bands to the law abiding members of the nations ham radio community. (ARNewsline(tm), RAIN)

FA: Moradco CM-3 CONELRAD Monitor Receiver. Tube type (a real BA!),
covers the
AM radio band from 540 to about 1750 Kilocycles. with "CD" markings at
640 and 1240 Kc., and seems to work well. It has an alert function so
that if the station being monitored goes off the air, it sends an
audible tone. There is a fahnestock clip on the back of the receiver for
an external wire antenna, if needed. A piece of Cold War history - every
ham used to be required to monitor!

Hello all
I am working on a previously repaired S-22. I am looking for either the two trimmer pad assemblies, both of which are dual trimmer pads, or for at least the one which tunes bands 2 & 4. A very good alternative would be an original manufacturers part number so I could try to find some NOS. These trimmer pads are about 1-1/2" square, and mount to the chassis with one screw and nut. The values are 100 mmfd / 1080 mmfd for the one I need worst and 50 mmfd / 375 mmfd for the other one. I would also consider buying a scrap chassis or complete basket case receiver for parts. I also need the two chrome trim pieces for the sides of the case.
Thankyou

I have for sale a GRC-9 militairy HF tranceiver

The set was license build by T.R.T. France (don't worry, English language on the set). The cabinet, TX- and RX units are cosmetically and electricaly very nice and the set is in good working condition. The GRC9 comes with a photocopy of the Technical manual TM 11-263.

Pictures of the set can be send via Email if interested.

Price of the set is 100US$, shipping will be 40US$ extra when send via economy mail, 60US$ via standard mail (prefered) or 70US$ send via priority mail.

I'm located in the Netherlands,

Regards,

Nico PA3ESA

How does this "mod" allow the radio to generate FM?

Are generating AM in the SSB generator, and then using the amplifier as a linear?

Or, are they adding an external high level AM plate modulator to the set?

If they are generating the AM in the SSB modulator, and amplifying it in the PA in
a linear mode, the rig cannot put out 100 watts carrier unless it can also do the 4x PEP
that AM produces.

If they are running an external high level plate modulator, then the rig must be running
the modulated stage in Class C.

I'm rather leary of the 100 watt carrier claim, 25 watts seems much more reasonable.

HEWLETT-PACKARD 355C and 355D Style Electrically operated Attenuators
50 ohm:

I have this interesting set of attenuators, obviously HP 355C and
355D 0-110db attenuators but instead of the normal rotary switches,
these are operated by 28 volt solenoids (!). They appear to be from
some sort of military equipment as they have the number FSN
5985-X44-0516 painted on them and have military style mountings and
connectors.

I was wondering if anybody recognized them and could tell me what sort
of equipment they were used or had any other information on them.

I have posted pictures at:
Please e-mail.

Thanks for reading,
Mike

5534. Trance-Formation of America: Epilogue

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-28 21:02:54 UTC
From: will@trance-formation.org
Message-ID: <4e187942.9b1f221c@trance-formation.org>
Source record: 46337
Cross-posted to: rec.sport.squash,rec.arts.tv.uk.misc,rec.games.diplomacy,rec.radio.amateur.boatanchors

The safety and serenity of Alaska provided an atmosphere conducive to deprogramming, despite the pandemonium that ensued. Mark Phillips was the first man who not only did not abuse us, but cared for our welfare and well being. His patient, gentle manner was therapeutic, while his propensity for handling weapons and apparent intellect kept us safe against all odds. Through his noble actions, Mark taught Kelly and me that the world of human interaction in which we had existed for so long was contrary to most human behavior. We learned that goodness does exist on this Earth, and that there were those in Washington, D.C. who refused to tolerate the mind-control atrocities they witnessed us and others enduring.

As my eyes opened and I woke up to reality, I became enraged. Enraged for the traumas inflicted on my daughter. Enraged for a lifetime of abuse at the hands of our country's so called "leaders". Enraged that the American public had no idea as to who and what was/is running their country. Mark helped me refocus my rage in a productive direction when he told me, "The best revenge is total recovery."

I began recovering at the rate of 18 hours a day through intensive therapy destined to restore my memory and, ultimately, my mind. I learned the ins and outs of my own mind and recovered my memories in a journal. The stack of journals grew as over a decade of White House/ Pentagon-level abuse flooded my mind and intruded on my thoughts. Pictures from my past flashed across my mind as neuron pathways opened in my brain. I was regaining access to my own mind and control over my future by recovering my memory of my past.

Best of all, I was falling deeply in love with Mark Phillips. Why wouldn't I fall in love? He rescued my daughter and me from certain demise, restored my free will, and was helping me recover in total safety, and was the polar opposite of my abusers. He treated me with love, respect, and thoughtful consideration . Equally as important, Mark proved to be an ideal father figure to Kelly. He provided here with unconditional love and deep understanding. Through him, Kelly caught a glimpse of how kind men could be--and how good life could be. I had long since ceased to know that such a man even existed.

The love factor in my recovery is considerable. Not only did Mark Phillips save my life, but now I had a reason to live it! The love we share kept me going at times--like when Kelly was institutionalized in 1989 for homicidal/suicidal behavior. The loving relationship that Mark shared with Kelly during our short year together as a family was sufficient to arm here with the strength to survive her ensuing ordeal

as a victim of the so-called mental health and criminal justice system.

Kelly, now 15, remains a political prisoner in the custody of the State of Tennessee where she is denied qualified therapy for the MK-Ultra Project Monarch Mind-Control abuses she endured. The state of Tennessee, under the politically powerful influence of Kelly's abusers, is in violation of numerous laws and basic civil rights in their determined efforts to keep Kelly from qualified therapy and the family she loves.

While many of those in positions to make a difference in Kelly's case operate on a "Need to Know" basis rather than deliberately conspire with the bad guys, a closer look into Kelly's case history should raise serious questions in their minds. Questions like; "What could a child have to do with the so called "National Security" of our country?" The Juvenile court judge presiding over Kelly's case closed the doors to the media and onlookers for "reasons of National Security" while gross and blatant violations of laws and rights ensued.

For over three long years, Kelly and I have been denied our right to an unbiased attorney while court-appointed advocates and so-called "guardians" join forces with attorneys paid off by me pedophile father. My own court-appointed attorney, who doubles for the Juvenile Court judge when he takes a day off, has yet to represent my interest. My interest is in Kelly's well being and future-- and if she will have a future at all.

While Kelly is still amnesic with regard to most of her past, she is deliberately denied therapeutical access to her past, due to who and what she will recall. I am denied access to Kelly for fear she would be triggered into remembering by my mere presence. As for my deliberately "triggering" Kelly to remember what she was supposed to forget, as her abusers fear, it has been my experience that recovery must come from the inside out. Not from outside input. I want no less for Kelly that the piece/peace of mind I have gained through qualified rehabilitation. Which raises the questions: Why has the Juvenile court prohibited us from saying the name "George Bush?" Why is the "Wizard of Oz" a taboo subject for Kelly while the State of Tennessee provides her with Stephen King horror novels? Why are Kelly and I forbidden by the court to say the words "President," "politics," New World Order", and "mind-control"?.

In an attempt by state employees to "normalize" our relationship, Kelly and I are forbidden to discuss the past, my immediate efforts to affect her dire and desperate situation, or future plans as a family.

Most appalling and unjust in Kelly's view is the State of Tennessee's refusal to allow her any contact whatsoever with Mark Phillips. While I am hindered from having private conversations with my daughter due to court ordered supervisions and censorship, Kelly is denied the right to even wave to Mark across the parking lot. Considering that, like me,

Mark has never been named as an abuser, declared unfit, or violated any court orders, the questions must be asked: "Why does the State of Tennessee go to such lengths to ban all communication between Kelly and the man who rescued her and taught her the meaning of unconditional love?"

Kelly has asked these questions for years to no avail. The State of Tennessee refuses to even acknowledge her request for"an unbiased attorney who will represent her interests instead of those of the state". Kelly's pleas for an attorney to represent her go no farther than the deaf ears of the assigned state social worker "managing" her case. This social worker is operating on a "Need to Know" basis that has no basis, and she "Needs to Know" that she, along with the State of Tennessee, will be held accountable in the event that Kelly hurts someone or herself.

Kelly's frustrations have mounted beyond her ability to cope. I applaud Kelly for her determined but weakened efforts to stay in control of her own mind despite being denied qualified rehabilitation for the devastating results of Project Monarch Mind-Control abuses. Kelly's daily attempts to accomplish the impossible by psychoLOGICALLY managing her psychiatric disorder is proportionate to her high intellect and willful determination. But it is not enough to fend off the Psychological Warfare that has been waged against her through CIA Damage Containment practices designed to keep her contained in amnesic silence. She needs help. She needs a collective voice.

Kelly can be helped through public outcry and through abolishment of the 1947 National Security Act (and 1984 Reagan Amendment to same) that has destroyed the true security of our once great nation. You can write the State of Tennessee demanding to know why Kelly is being denied her right to qualified rehabilitation.

Thank you. - Cathy O'Brien

Every submitted comment of encouragement will be greatly appreciated!

For Sale:

Beautiful Collins KWM-2 Transceiver (no mods) all stock crystals in excellent condition both physically and electronically. In use now. Serial number 15,xxx Winged Emblem. Non-Smoker.
Reason for selling: Have KWM-2A also and decided to part with one of the rigs.
$800

Collins 312B-4 Round Emblem. Cosmetically Excellent although needs some minor work/adjustments to get power meter to correctly measure. Will only measure high power scale right now.
$275*

Collins PM-2 Power Supply for KWM-2. Works in very good condition. Not being used presently.
$250*

All for $1200 *(will separate if KWM-2 is sold alone)

73,
Jack

5536. Sick SX-101A

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-28 21:36:08 UTC
From: Mark Bell <bell@blazenet.net>
Message-ID: <u2ppo3s5quqp87@corp.supernews.com>
Source record: 46329

My SX-101A decided to get more sick the other day.

Previously, USB would not work after the unit warmed up. Then, USB would not work at all. The other day, LSB decided to stop working every now and again.

Taking scope in hand, I think I tracked it down to V4, the 1650 Khz IF Amp. The output of this tube is the expected frequency (1650) (about 50 mV Peak to Peak). This is present ONLY on the two LSB positions, and NOT on either of the USB positions.

I can't figure out why this IF Amp would care about the USB/LSB selection! That's handled downstream.

The input to this amp looks to be a composite sine wave with an overall period of 5 Mhz. Since an input to the first mixer is from the 1st Conversion Oscillator (5 Mhz on 80M), I figure this is OK, but I can't be sure.

I've done the obvious like replace tubes etc. The Response switch was previous cleaned with Deoxit.....

Any comments?

Mark K3ZX

Mike--

A search at www.agilent.com for 355C turned up a bunch of hits, most of
which looked good -- check it out, as service and operations manuals
are online for a lot of things, including some older equipment.

(Agilent is the name of the HP components/test/measurement business)

Does it behave the same way with the AVC off?
That set is of the vintage to where you have to worry about the
intermittent sandwich micas inside the IF cans, assuming thats what it
uses. A recent S-107 project of mine required replacing ALL of them.

Mark....sounds like the USB crystal for the product detector could be
getting weak. Or, a change in circuit constants would make it hard to
keep in oscillation. Look at the output of BFO osc with your scope
on both sidebands. I'd offer that you might see a big change between
LSB and USB.

Good luck

Doug, K7YD

hey neil
rather than getting and spending the big bucks for the civ-17
check out .www.hosenose.com they make one that is only $48 and it works
as well as the one from icom
i a, currently using the one from hosenose and it works really well with
my 706 MrkII

From what I remember a Zener diode go's tits up, It Sets the bias on the
12AX or T7 relay driver cathode
The wrong relay with a higher coil impedance will do it to

Wait till you hear the VFO drift and harsh receive audio.
Run a dedicated shielded cable under the crossmember from the volume control
to the product detector to loose low the hum, all the HW-100, 101 and
SB-100, 101, 102 have this audio problem
(all the same basic chassis)
I still have my old manual someplace, those HW series VFO's were dreadful.

OK, I got a lot of responses ! Thanks!

Just about eveyone said the check v5 and v12 and the two
crystals. I had already performed the checks on the tubes.
I cleaned the crystal leads a while back (as I did the Response
switch) etc, but I'll wiggle the crystals again.

Can someone explain to me the absence of a signal in USB
at the INPUT to V5? I assume it's supposed to be there,
that's why I looking there and back, and not at v5 and v12!

If it were there for both LSB and USB, and the USB signal
was missing at the output of T4, that'd point directly to v5 and V12!

Here are my feedback rules for your consideration, folks:

1. Never threaten to neg someone, but let them know that you WILL leave appropriate feedback for the transaction. That is not a threat, it is an affirmation that you use the feedback system as intended.

2. Read the feedbacks of buyers & sellers you may become involved with, read between the lines, read the response (if any) to any negative comments. If neg'ing is such a retaliatory thing, then nearly 50% of the negs must be unfounded. It is not impossible to figure out the difference between "This guy is a JERK! DO NOT BUY FROM", and, "Item was not as described, seller would not reply to emails." Trust your ability to judge people by their comments.

3. No negs doesn't mean someone is a good ebayer - it may well mean that the dissatisfied customers (even with legit gripes) were afraid to post a neg lest they get neg'd back. To say 'I only buy from people with no negs' and then to say 'I never leave negs because of possible retaliation' makes NO sense.

4. Never leave a positive feedback on a sale until the buyer has the item and is happy with it - and preferably has already left you a positive. Leaving a positive before the transaction has proved satisfactory to both sides, makes it impossible to go back and leave the deserved neutral or negative if the other party starts to pull something unfair or an item you buy is not as expected. You might sell something very nice and the buyer might make up a problem and want a credit or refund - if you have already left a positive, you're wide open to receive a negative and yet you've already posted nice comments about the jerk!

5. Feedback can only be left 90 days following an auction. If you want to neg someone, wait 89 or 90 days. The other person will not likely see the neg in time to respond or retaliate as the time window will be past. And won't they be surprised when they DO see it... there is an old proverb, "Revenge is best when served cold."

Source record: 46248
Cross-posted to: rec.radio.swap,misc.industry.electronics.marketplace,sci.electronics.equipment,rec.radio.amateur.boatanchors

Mike,

HP made a series of 355C/D/E/F Manual and Programmable Step Attenuators. The HP 355C/E provide 0 to 12 dB in 1-dB steps and the HP 355D/F provide 0 to 120 dB in 10-dB steps. For the HP 355E and 355F models, attenuation programming is done through a 7-pin connector.

The specs (from the '87 HP Catalog) are:

HP 355C/D: dc to 1 Ghz; SWR Max (50 ohm nominal): dc-0.25 GHz, 1.2; dc-0.5 GHz, 1.3, dc-1.0 GHz, 1.5.
Insertion Loss (0 dB setting) 0.11 dB + 1.39 dB/GHz
Power Rating: 0.5 W avg, 350 W peak
Solenoid Voltage/Speed/Power: 15-18 V; <65 ms; 3.0 W

Hope this helps.

Lew

There is no FM on the TS-830. I think that was just a typing error though. In AM mode the 90 watts I am running is the plate INPUT power, not output (900 Vdc x 100 mA). The actual carrier output to the 50 ohm load is significantly less due to efficiency.

The rig is low level modulated and then heterodyned to the correct frequency. As read on a Bird wattmeter, the total output power (AM DSB) to the load will approach 125 watts with 100% modulation. Attempting to exceed that level will cause the ALC to reduce the drive to the finals and there will be a visible drop in the plate current on the front panel meter as well as audible distortion of the received signal.

I think the new solid state rigs are rated on output but the old tube stuff was spec'd on input power. This does cause some confusion when comparing equipment.

I found a website that has specs for the M and they do indeed rate it at
80 watts input on AM

http://www.qsl.net/sm7vhs/radio/kenwood/ts830/specs.htm

I've found a challenging project while I'm "between assignments" (that's computer geek speak for unemployed). I'm joining members of the Azalea Coast Amateur Radio Club (AC4RC) in refurbishing the radios and antennas aboard the Battleship North Carolina - http://www.battleshipnc.com/page1.htm - where she sits at anchor here in Wilmington NC. So far they have the CW transmitter working and work progresses SLOWLY on the AM transmitter.

Here's a story about the work done so far. http://www.ac4rc.org/battleship_radios/battleship_radio_project.htm Be sure to click the PHOTOS link to get a look at the immensity of the project.

If you're ever visiting the NC Coast the battleship is a great attraction, and the radios will soon bring back the voice of the "Showboat"

From: Tom Boyd <btse1@attbi.com>
Message-ID: <7voX7.12171$kK1.88665@rwcrnsc52>
Source record: 46258

I found a Collins filter mounted inside what looks like an oversize i.f. transformer can, stamped Millen 80005. Data on the Collins label says

Type F 465 K 25
Ser 34 2412 9
P/N 082 0006 526

Information I have so far indicates it's a filter for a 465 kHz i.f. and has a 2.5 kHz bandpass at 3 or 6 db down. It's clearly for old tube gear -- note the grid cap on one of the leads.

Did Millen install Collins filters in an application like this? Anyone know what this might be from? Could it even have been brewed up by a very competent home constructor, i.e., installing the filter in a Millen can that happened to be of a convenient size?

TIA for any info,
Tom

I remember Millen or maybe it was Miller selling filters back in the
50s/60s. I think you'll see them in some of the ARRL prjects. Didn't
know they used the Collins inside, tho.

Source record: 46262

Are all the Hammarlund SP-600-JX-17's diversity receivers?
The one I'm looking at (S/N 16959) has several red knobs, is rack-mounted,
and has an antenna input coming out the open top.

Is it safe to just power it up and see what it does? It's been attic'd for
15 years. I know I'll need high-impedance phones or speaker to test it.

What's it worth in unknown operating condition? It's in "fair" condition
cosmetically, mostly just dusty.

5569. Help: unknown valve

Hil,

A box of totally unknown valves was found when we were counting valves
and other components in these last days of 2001.
It is a 7-pin miniature type, like 6C4 and others, and it is made by
the Swedish factory LM Ericsson. It is RZC 1021 and I would guess that
it is some kind of a trigger or maybe a voltage stabilizer. It has
only two vertical metalplates inside the bulb. No ordinary cathode or
grid.
Can anyone help?

Best regards,

Arnold Goksyr

DRAKE TWINS PLUS ACC. NICE

Hi, I have a nice set of drake twins. T4XB transmitter, R4A Receiver.
Have replaced the output and driver tubes in transmitter. Both units
have been algined by KG4H. Also have power supply for transmitter
new caps etc. in it, been rebuilt. Both units have had the blue filters
replaced on the vfo's and meters. the T4XB is orginal piant,
copper is nice.Face is really nice. The R4A has been repainted the
faceplate does show some paint fade no scrathes or letters rubbed off,
copper need some cleaning. Have made up proper jumper cables
RG-174u,
not the cheap phono cabes. Also included is a Brand new Shure 450 Hi
Impedence desk mic. The R4A has the following extra crystals
12.5,13.0,29.1,36.6,37.6,38.1,39.1 in addition to the factory stock
10-80.
The T4XB has the following extra crystal 37.6 in addition to factory
stock 10-80. Full output on all bands since new tubes were put in the
transmitter. These units work really well together. All knobs are in
good shape feet also doubled up to give rise on front. These units are
ready to go on the air been using them nightly. work perfect. Been
out of work for a bit so need to sell some excess gear. asking 500.00 +
shipping.
OBO You won't be disapointed. will not separate sold as package deal
only.

Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.boatanchors,rec.radio.swap

Hello all,

Does anyone have a NICE LOOKING WHITE tube-type
table radio they would like to sell?

Any brand ok, and AM-only is perfect. But needs to work
well, and be original and WHITE. Plastic case is fine.
Mayb an old Zenith with the round dial? My dad had one
when I was a kid. But anything decent should do nicely.
Collector models and condition is not important, as long
as it works and looks decent enough for a kitchen radio!

I just redid my kitchen 'retro' 50's and I want a good
table radio for the counter.

Email price, condition, and all that.

Dave in Tacoma

Hello group
The high tension powersupply for my old Hallicrfter tx needs new filter capacitors, several different,
all 400-450 V, 8 , 16 myF , the ones I can buy today are much smaller, say 70 % length and dia.
As there always is some leakage and thus power that needs dissipation are they so much better
leakage -wise e.t.c that I can use them same voltage es myF, or should parallell them?
Do U have any experiences?
tnx in advance and seasons greetings/ per

The newer style ones actually have considerably less leakage than the
old big ones. There is always a question as to how long they may last
though. I use them routinely in restoration of old radios and haven't
experienced any problems. If you have the choices, go for the
High-temperature versions...105C instead of 85C.

5584. Atlas 210 for sale!

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-12-30 15:16:57 UTC
From: Frank Krozel <frank@electronicinstrument.com>
Message-ID: <a0n41mdqt1@slb6.atl.mindspring.net>
Source record: 46274

Hi all:
Extra to my needs, very clean Atlas 210.
This system comes complete!
Aligned, updated about a year ago, new pieces etc to make it look real good.
Comes with the slide in base power supply with a built in speaker
Also, the microphone (hand mic) as well. Yes, original manual is
included.
80-10 meters
Last, I do have the slide - in mobile mounting bracket.
I will sell for $250 plus shipping.
This radio has been stored since it was updated!

Source record: 46275

Hi all:
Have a good HW-100, for trade.
This radio looks good, and makes rated power output!
Has a minor problem, that is probably tube related.
I would like to trade for a 45 watt two meter rig...
Also, would include a homemade power supply with it.
Frank KG9H

hi i just listed a hw16 on the eham site, i have a hw16 thats very clean
although some of the lettering is worn off the back side, it works quite
well and i have used it for qso's on 40 meters. only thing i can see
thats different from stock is someone replaced a couple of sections of
the multicap in the power supply by adding a couple of capacitors across
the orginal. asking $85 plus shipping

I have a Crystal Calibrator NT11 for the WWII WS19 (Cdn) HF vehicle set.
This Crystal calibrator mounts on top or the side of the power supply. It
is complete with cables and in good condition but I don't know if it's
working (and I mean I really don't know, I never tried it)
Price is 55US$ excluding shipping cost (unit is not heavy) I have schematic
and some documentation available.

If interested I can Email picture. (I have some more WS19 accessories
available like cables, headsets, etc.)

Regards

Nico PA3ESA

I'm located in Holland

Hi Mike,

Every SX-23 I have seen has the same two knobs in the same bad shape.

I'm planning to use two later Hallicrafters knobs of similar appearance on mine. This will allow operation of the radio with little visual degrading.

If you are looking for a 100% original restoration for contesting, I can't beleive any Old Radio Contest Judge would mark you down for not having good original knobs there. I wouldn't. The knobs just weren't made to hold up over time.

Of course, some of us could get together and have a few cast in something that looks correct, but is more durable -- but the 100% original aspect would still be lost.

Allow me to make a plug for Larry Bordonaro...oldtimerep@aol.com He
does replications for old radio knobs and bezels and does quite a nice
job...as fine as the originals although they look new (duh).
He may already have these molds, if not, its not a costly proposition to
have him to make them from scratch. IIRC 15 bucks or so.

When you say original, remember that some of the internal parts like capacitors need to be replaced to make the radio function like it did when new. These parts usually reside hidden inside under the chassis. And definitely inside the cabinet. Of course you should demand that the original knobs be present.

Hello all
I am working on a previously molested S-22 Hallicrafters. This is NOT the "R" version. I have it working fairly well, but am finding the oscillator coil trimmers touchy to set, especially at the higher freq's. It also seems that if I so much as nudge one of the wires in the osc section I have to realign. Sooo - I wonder if someone could supply me with a photo of the underside of one of these, especially the coils and trimmer pads section, so that I can see where the wires are supposed to be routed.

Does anyone know where I can get a Dial Glass Pane for a 5R10?
I'd even settle for a nice photo copy of one. (Good enough quality to
use as a replacement)
Thanks!

Source record: 46215

These are pickup ONLY. I cannot ship at these prices.

Johnson Ranger I. Good condition, New Caps. $250 Picture on web site at: Http://pages.cthome.net/nord/Ranger.html

TCS 12 Complete package. Very rare to find it all together, it took me 4 years to amass all the pieces. Includes Transmitter, Receiver, Original Power Supply, Antenna Tuner, Remote Speaker Cables Mike, and Manual. Reciver and transmitter are slightly modified (swap out of ant. Jack) and show wear. UNTESTED $250

Hallicrafters SX-9 $250. Clean and working. Someone years ago added a tuning eye (works) and two nice looking jewel lights. (Purpose unknown). All recapped, resistors replaced as needed and realigned

Hallicrafters SX-22 Marine $60. Good working condition. Recently recapped and alighned. Fair shape. Case has some under paint corrosion marks.

Century 21 CW Transcever. $125. Nice looking radio. Works, but dial slips. Includes repair kit from Ten Tec and manual.

Again, pickup only

Also have a list of early BC revivers if interested.

Message-ID: <3C30AA84.F84492AE@mediaone.net>
Source record: 46220

For proper AM operation on any low level modulated rig the proper way to set it up is by watching output power. Forget what the input power is. Tune up for max output power just like you do for SSB operation. Then without touching the tuning controls, reduce the carrier level to 1/4 the full output. In other words, if you get 100 watts output with full carrier at tune up then reduce the carrier to 25 watts for AM operation. Then adjust the audio gain so that the power meter just wiggles upward slightly. That should give very good audio. If you figure the input power verses output power, the carrier efficiency should be around 30 to 35% in the AM mode.

Since AM has peak envelope power 4 times the carrier power it is necessary for the final to be tuned at the PEP power level so that the audio peaks do not flatten out.

This is correct. In addition, a scope would take some of the
guess work out of the fine adjustments.

Yes, I agree 1/4 power if the rig is running a linear PA; and a scope watching
for flattoping is a very good idea.

I'm no Collins collector, but my 32V2 looks lonely and doesn't seem to get along well with the NC-183D anymore, so I'm still looking for a good 75A and probably willing to pay enough to pry it out of your hands. I can pick up in New England, or have it picked up by a delivery service, which BTW ends up costing less than some UPS scenarios.

Quick deal for a good one with a decent front panel and no major internal catastrophes or rust.

Bob
W1XYZ
Sudbury MA

Also looking for a decent Eddystone Rx.
